Disclaimer Notice

THIS ANSYS SOFTWARE PRODUCT AND PROGRAM DOCUMENTATION INCLUDE TRADE SECRETS AND ARE CONFIDENTIAL AND PROPRIETARY PRODUCTS OF ANSYS, INC., ITS SUBSIDIARIES, OR LICENSORS. The software products and documentation are furnished by ANSYS, Inc., its subsidiaries, or affiliates under a software license agreement that contains provisions concerning non-disclosure, copying, length and nature of use, compliance with exporting laws, warranties, disclaimers, limitations of liability, and remedies, and other provisions. The software products and documentation may be used, disclosed, transferred, or copied only in accordance with the terms and conditions of that software license agreement.

ANSYS, Inc. and ANSYS Europe, Ltd. are UL registered ISO 9001:2000 Companies.

U.S. GOVERNMENT RIGHTS

For U.S. Government users, except as specifically granted by the ANSYS, Inc. software license agreement, the use, duplication, or disclosure by the United States Government is subject to restrictions stated in the ANSYS, Inc. software license agreement and FAR 12.212 (for non-DOD licenses).

Third-Party Software

See the online documentation in the product help files for the complete Legal Notice for ANSYS proprietary software and third-party software. The ANSYS third-party software information is also available via download from the Customer Portal on the ANSYS web page. If you are unable to access the third-party legal notices, please contact ANSYS, Inc.

Table of Contents

Preface	ix
l. Format of Binary Data Files	1–1
1.1. What Are ANSYS Binary Files?	
1.1.1. Conventions Used to Describe Binary Files	
1.1.2. The Standard Header for ANSYS Binary Files	
1.2. Format of the Results File	
1.2.1. Nomenclature	
1.2.2. Standard ANSYS File Header	
1.2.3. Results File Format	
1.3. Description of the Reduced Displacement File	
1.3.1. Standard ANSYS File Header	
1.3.2. RDSP File Format	
1.4. Description of the Reduced Complex Displacement File	
1.4.1. Standard ANSYS File Header	
1.4.2. RFRQ File Format	
1.5. Description of the Modal Results File	
1.5.1. Standard ANSYS File Header	
1.5.2. MODE File Format	
1.6. Description of the Element Matrices File	
·	
1.6.1. Standard ANSYS File Header	
1.6.2. EMAT File Format	
1.7. Description of the Substructure Matrices File	
1.7.1. Standard ANSYS File Header	
1.7.2. SUB File Format	
1.8. Description of the Triangularized Stiffness File	
1.8.1. Standard ANSYS File Header	
1.8.2. TRI File Format	
1.9. Description of the Full Stiffness-Mass File	
1.9.1. Standard ANSYS File Header	
1.9.2. FULL File Format	
2. Accessing Binary Data Files	
2.1. Accessing ANSYS Binary Files	
2.1.1. Access Routines to Results and Substructure Files	
2.1.2. Characteristics of ANSYS Binary Files	
2.1.3. Viewing Binary File Contents	
2.1.4. Abbreviations	
2.1.5. binini (Initializing Buffered Binary I/O Systems)	
2.1.6. Function sysiqr (Retrieving the Status of a File)	
2.1.7. Function biniqr8 (Retrieving System-Dependent Parameters)	
2.1.8. Function binset (Opening a Blocked Binary File or Initializing Paging Space)	
2.1.9. Subroutine bintfo (Defining Data for a Standard ANSYS File Header)	
2.1.10. Subroutine binhed (Writing the Standard ANSYS File Header)	
2.1.11. Subroutine binrd8 (Reading Data from a Buffered File)	
2.1.12. Subroutine binwrt8 (Writing Data to a Buffered File)	2–7
2.1.13. Subroutine exinc4 (Decoding an Integer String into a Character String)	2–8
2.1.14. Subroutine inexc4 (Coding a Character String into an Integer String)	2–8
2.1.15. Subroutine binclo (Closing or Deleting a Blocked Binary File)	
2.1.16. Subroutine largeIntGet (Converting Two Integers into a Pointer)	2–9
2.2. Demonstration Routines	2–9

	2.2.1. Program bintst (Demonstrates Dumping a Binary File and Copying It for Comparis	
	poses)	
	2.2.1.1. Common Variables:	
	2.2.2. Subroutine bintrd (Demonstrates Printing a Dump of File Contents)	
	2.2.3. Subroutine bintwr (Demonstrates Copying Binary File Contents)	
	2.2.4. Program wrtsub (Demonstrates Writing an ANSYS Substructure File)	
	2.2.5. Program rdsubs (Demonstrates Reading a Substructure File)	
	2.2.6. Program rdfull (Demonstrates Reading and Reformatting the .FULL File)	
	2.2.7. Program ResRdDemo (Demonstrates Reading a Results File)	
	2.2.8. Program ResWrDemo (Demonstrates Writing a Results File)	
	2.3. Results File Access Routines	
	2.3.1. Overview of the Routines	
	2.3.2. ResRdBegin (Opening the File and Retrieving Global Information)	
	2.3.3. ResRdGeomBegin (Retrieving Global Geometry Information)	
	2.3.4. ResRdType (Retrieving Element Types)	
	2.3.5. ResRdReal (Retrieving Real Constants)	
	2.3.6. ResRdCsys (Retrieving Coordinate Systems)	
	2.3.7. ResRdNode (Retrieving Nodal Coordinates)	2–15
	2.3.8. ResRdElem (Retrieving Elements)	
	2.3.9. ResRdSolBegin (Retrieving Result Set Location)	2–15
	2.3.10. ResRdDisp (Retrieving Nodal Solution)	2–16
	2.3.11. ResRdRfor (Retrieving Reaction Solution)	2–16
	2.3.12. ResRdFix (Retrieving Applied Nodal Constraints)	2–16
	2.3.13. ResRdForc (Retrieving Applied Nodal Loads Solution)	2–16
	2.3.14. ResRdEstr (Retrieving Element Solutions)	
3. l	Jsing CDREAD and CDWRITE	
	3.1. Using the CDREAD Command	
	3.1.1. Tips for Reading Files with CDREAD	
	3.2. Using the CDWRITE Command	
	3.2.1. Customizing Degree of Freedom Labels: the /DFLAB Command	
	3.3. Coded Database File Commands	
	3.3.1. CE Command	
	3.3.2. CP Command	
	3.3.3. CMBLOCK Command	
	3.3.4. EBLOCK Command	
	3.3.5. EDCADAPT Command	
	3.3.6. EDCGEN Command	
	3.3.7. EDCURVE Command	
	3.3.8. EDDRELAX Command	
	3.3.9. EDLCS Command	
	3.3.10. EDLOAD Command	
	3.3.11. EDPREAD Command	
	3.3.12. EDWELD Command	
	3.3.13. EN Command	
	3.3.14. LOCAL Command	
	3.3.15. M Command	
	3.3.16. MPDATA Command	
	3.3.17. MPTEMP Command	
	3.3.18. N Command	
	3.3.19. NBLOCK Command	
	3.3.20. R Command	
	3.3.21. RLBLOCK Command	3–15

3.3.22. SECBLOCK Command	3–16

List of Figures	
4.1. Display Format for Z-buffered Graphics	
12. Example Display of a Graphics file	т /

Preface

Conventions Used in This Guide

Indicates

This guide uses the following typographic conventions to indicate various types of information:

Convention	Indicates
COMMAND	ANSYS commands. These are shown as uppercase, bold text (for example, K , DDELE , and so on). In the online documentation, these provide hyperlinks to the appropriate command reference information.
Menu > Item	Menu paths (sometimes referred to as GUI paths). These are shown as bold text with mixed-case, separated by angle brackets ">". An angle bracket indicates a branch to a new menu item.
path/filename.ext	File names, which may or may not include directory paths. These are shown as lower-case, bold text, unless case is significant. Examples are shown with the UNIX directory separator character "/" (slash); if you are using a Microsoft Windows system, use "\" (backslash) as your directory separator character.
ARGUMENT	Arguments for numeric values (such as <i>VALUE</i> , <i>INC</i> , <i>TIME</i>) in command syntax. These are shown as upper-case italic text. On some commands, non-numeric convenience labels (for example, ALL and P) can also be entered for these arguments.
Argument	Arguments for alphanumeric values (for example, <i>Lab</i> or <i>Fname</i>) in command syntax. These are shown in mixed-case, italic letters. The guide also uses italic text for emphasis.
ANSYS Guide Title	The name of an ANSYS manual.
command, arg1, arg2	Command input listings, ANSYS output listings, and text that a user enters are shown in fixed-width font.
Note	Information that supplements the main topic being discussed, such as important tips or guidelines.
Caution:	Actions or situations that could cause problems, unexpected ANSYS behavior, or unexpected results.
Warning	Actions or situations that can shut down ANSYS, damage files, cause loss of data, and so on.

About the Programmer's Guide Set

The ANSYS programmer's guide set provides information about the various programming interfaces available to customers. These manuals assume that you have at least a basic knowledge of programming (a working knowledge of Fortran 90 would be very helpful). The set of four manuals includes:

The APDL Programmer's Guide

This guide was designed for ANSYS users that have some programming skills and wish to tap the power of the ANSYS Parametric Design Language (APDL) to increase the productivity. APDL is a scripting language that is very similar to Fortran 90. The guide describes how to define parameters (variables), how to create macro programs using APDL, how to use APDL for simple user interaction, how to encrypt an APDL macro, and how to debug an APDL macro.

The UIDL Programmer's Guide

The UIDL Programmer's Guide covers the User Interface Design Language (UIDL) including how to modify or construct menus, dialogs and online help from within ANSYS.

Guide To ANSYS User Programmable Features

ANSYS provides a set of Fortran 90 functions and routines that are available to extend or modify the program's capabilities. Using these routines requires relinking the ANSYS program, resulting in a custom version of ANSYS. ANSYS provides an external commands capability which you can use to create shared libraries available to ANSYS (either from ANSI standard C or Fortran 90). you can use this feature to add custom extensions to ANSYS without the need to rebuild the ANSYS executable.

Guide to Interfacing with ANSYS

This guide describes a group of utilities as well as a set Fortran 90 routines that you can use to directly access the ANSYS database. You can also use these capabilities to access data in any of the binary files that ANSYS writes or uses.

Chapter 1: Format of Binary Data Files

1.1. What Are ANSYS Binary Files?

The ANSYS program writes several binary files to store data during an analysis. These files are named **Jobname.ext**, where **Jobname** is the name of the analysis that caused the file to be generated and **.ext** is an extension indicating the type of data in the file. ANSYS-written binary files include the following:

- The following results files, in which the ANSYS program stores the results of solving finite element analysis problems:
 - Jobname.RST A structural or coupled-field analysis
 - Jobname.RTH A thermal analysis
 - Jobname.RMG A magnetic analysis
 - Jobname.RFL A FLOTRAN analysis
- The Jobname.MODE file, storing data related to a modal analysis
- The Jobname.RDSP file, storing data related to a reduced transient analysis.
- The Jobname.RFRQ file, storing data related to a reduced harmonic analysis
- The Jobname.EMAT file, storing data related to element matrices
- The Jobname.SUB file, storing data related to substructure matrices
- The Jobname.TRI file, storing the triangularized stiffness matrix
- The Jobname.FULL file, storing the full stiffness-mass matrix

The files listed above cover almost all users' needs, although there are others. For more information, see the ANSYS Basic Analysis Guide.

1.1.1. Conventions Used to Describe Binary Files

In the information describing the binary file formats:

- Record ID is the identifier for this record. Not all records will have identifiers; they're indicated only for records whose record pointers are stored in a header.
- Type indicates what kind of information this record stores.
- Number of records indicates how many records of this description are found here.
- Record length indicates the number of items stored in the record.

In some record descriptions, actual variable names used may appear in the record contents area.

1.1.2. The Standard Header for ANSYS Binary Files

Each of the ANSYS program's binary files contains a standard, 100-integer file header that describes the file contents. The header contains the items listed below, always in the order shown:

Item 1	The file number
Item 2	The file format. This item has a value of 1 if the file is small format, -1 if large format.

The time, in compact form (i.e., 130619 is 13:06:19)					
The date, in compact form (i.e., 20041023 is 10/23/2004)					
The units of measurement used. The value of this item is as follows:					
0 for user-defined units					
• 1 for SI units					
• 2 for CSG units					
3 for British units (feet)					
4 for British units (inches)					
4 101 Bittisti utilits (inches)					
The ANSYS release level in integer form ("X.X" in character form)					
The date of the ANSYS release					
The machine identifier in integer form (three four-character strings)					
The <i>Jobname</i> in integer form (two four-character strings)					
The ANSYS product name in integer form (two four-character strings)					
The ANSYS special version label in integer form (one four-character string)					
The user name in integer form (three four-character strings)					
The machine identifier in integer form (three four-character strings)					
The system record size					
The maximum file length					
The maximum record number					
The Jobname (eight four-character strings)					
The main analysis title in integer form (20 four-character strings)					
The first subtitle in integer form (20 four-character strings)					
The split point of the file					
LONGINT of filesize at write					

1.2. Format of the Results File

The next few pages describe the format of the ANSYS results file. (In the following tables, records with a record ID containing an asterisk (*) are those you can read and store into the ANSYS database via the **LDREAD** command.)

Note: The pointers in the solution data headers are relative, not absolute pointers. For example, the 12th item in the solution data header will be relative to a position in the Data Set Index (ptrESL = DSI (i) + ptrESL).

This section explains the contents of the results file; that is, those files with the following extensions:

.rfl	.brfl
.rmg	.brmg
.rst	.brst
.rth	.brth
.lnn	

1.2.1. Nomenclature

A load case contains the results for an instance in an analysis. A load case is defined by a load step number and a substep number. A load case is also categorized by a cumulative iteration number and time (or frequency) values. A load case is identified by all three methods in the results file.

The results file does not have to contain all the load cases of an analysis.

A data set is used in this chapter to designate a load case.

For a complex analysis, there will be two data sets for each load case. The first data set contain the real solution and the second contains the imaginary solution.

1.2.2. Standard ANSYS File Header

See Section 1.1.2: The Standard Header for ANSYS Binary Files for a description of this set. File number (Item 1) is 12.

1.2.3. Results File Format

```
*comdeck,fdresu
c *** ansys(r) copyright(c) 2000
c *** ansys, inc
      ******* description of results file
C
     --- used for the following files:
С
С
        .rfl

NOD	i	1	nnod	Nodal equivalence table. This table equates the number used for storage to the actual node number (baclst(i),i=1,nnod)
ELM	i	1	nelm	Element equivalence table. The ANSYS program stores all element data in the numerical order that the SOLUTION processor solves the elements. This table equates the order number used to the actual element number
DSI	i	1	2*resmax	Data sets index table. This record contains the record pointers for the beginning of each data set. The first resmax records are the first 32 bits of the index, the second resmax records are the second 32 bits. To create the 64 bit pointer, use: LONGPTR = largeIntGet (first, second) Read the solution data header as follows: call bioBasePut (nblk,LONGPTR) loc = bioiqr (nblk,12) call biord (nblk,loc, The rest of the file reading continues to use the ptrXXX's that are in the headers.
TIM	dp	1	resmax	Time/freq table. This record contains the time (or frequency) values for each data set.
LSP	i	1	3*resmax	Data set identifiers. This record contains the load step, substep, and cumulative iteration numbers for each data set.
TRAN	dp	nTran	25	Substructure transformation vectors
GEO	i	1	40	Geometry data header(was 20 in 32 bit vers)
				O,maxety, maxrl, ndnod, nelm, maxcsy,ptrETY,ptrREL,ptrNOD,ptrCSY, ptrEID, 0, 0, 0, 0, ptrMAS,csysiz,elmsiz,etysiz, rlsiz, ptrETYL, ptrRELL, ptrCSYL, ptrNODL, ptrEIDL, ptrMASL, 0, 0, 0, 0, 0, 0, 0, 0 each item in header is described below: O - position not used maxety - the maximum element type reference number in the model maxrl - the maximum real constant reference number in the model ndnod - the number of defined nodes in the model maxcsy - the maximum coordinate system reference number in the model ptrETY - pointer to the element type index table ptrREL - pointer to the real constant index table ptrNOD - pointer to the nodal point locations ptrCSY - pointer to the local coordinate system index table ptrEID - pointer to the element index table O - position not used

                                    each item in header is described below:
С
                                    pv3num - current solu set number
C
                                           - number of elements
C
                                           - number of nodes
C
                                    nnod
                                           - bitmask for the existence of
C
                                    mask
С
                                              several records. If a bit is set
                                              here, it indicates that the
C
                                              corresponding record exists on the
С
С
                                              file.
C
                                              The items in the bitmask that
С
                                              correspond to each record are shown
С
                                              in the record descriptions below.
С
                                     itime - loadstep
С
                                     iter
                                            - iteration number
                                    ncumit - cumulative iteration number
C
                                         - number of reaction forces
С
                                     cs_LSC - cyclic symmetry count of the
                                             load step for this SOLVE
C
С
                                    nmast - number of masters
                                    ptrNSL - pointer to nodal solution
С
                                    ptrESL - pointer to element solution
C
                                    ptrRF - pointer to reaction forces
С
                                    ptrMST - pointer to the masters
C
                                    ptrBC - pointer to the boundary conditions
C
                                     rxtrap - key to extrapolate integration
С
С
                                              point results to nodes
                                              = 0 - move
С
С
                                              = 1 - extrapolate unless active
                                                    non-linear
C
С
                                              = 2 - extrapolate always
С
                                     mode
                                            - mode number of harmonic loading
```

```
(for cyclic symmetry: this is cs_LSF
C
                                              = first load step for this SOLVE)
С
                                            - symmetry for harmonic loading
С
C
                                              (for cyclic symmetry: this is cs_LSL
                                              = last load step for this SOLVE)
С
С
                                     kcmplx - complex key
                                              = 0 - real
C
С
                                              = 1 - imaginary
                                     numdof - number of DOFs/nodes for this data
C
C
                                              set
                                     DOFS
                                            - DOF/node reference numbers (numdof
C
С
                                              values)
                                     title - main title (in integer form)
C
С
                                     stitle1- 1st subtitle (in integer form)
                                     dbmtim - time (in compact form) when the
C
                                              database was last modified
С
С
                                     dbmdat - date (in compact form) when the
                                              database was last modified
C
С
                                     dbfncl - number of times that the database
                                              was modified
C
                                     soltim - time (in compact form) when the
C
                                              solution for this data set was done
С
                                     soldat - date (in compact form) when the
С
C
                                              solution for this data set was done
                                     ptrOND - pointer to the ordered node list
C
                                              (load case files only)
C
С
                                     ptrOEL - pointer to the ordered element list
С
                                              (load case files only)
                                     nfldof - number of extra Flotran DOFs/nodes
C
                                              for this data set
С
С
                                     ptrEXA - pointer to header extension for
                                              FLOTRAN DOF/extra DOF list.
С
С
                                     ptrEXT - pointer to header extension
C
C
                                     Note: ptrXXX are relative to ptrDSI
                               100
                                     Solution header - double precision data
            dр
                     1

С					ANSYS Commands Reference.
	ENF	dp	1	varies	Element nodal forces. This record contains the forces at each node, in the same DOF order as the DOF number reference table. For static, damping, and inertia forces, a set of forces will be repeated (as appropriate). Number of data items stored in this record can be calculated as follows: nodfor*NDOF*M, where NDOF is the number of DOFs/node for this element, nodfor is the number of nodes per element having nodal forces (defined in element type description record), and M may be 1, 2, or 3. For a static analysis, M=1 only. For a transient analysis, M can be 1, 2, or 3.
	ENS	dр	1	varies	Element nodal component stresses. This record contains the stresses at each corner node, in the order SX,SY,SZ,SXY,SYZ,SXZ,S1,S2,S3,SI,SIGE. Nodal order corresponds to the connectivity defined in the element description. Stresses can be nodal values extrapolated from the integration points or values at the integration points moved to the nodes. If an element is nonlinear, integration point values always will be written. (See item rxtrap in the solution header for the setting.) An element is considered nonlinear when either plastic, creep, or swelling strains are present.
					* For solid elements, stresses are at each corner node and the number of items in this record is nodstr*11. * For shell elements, stresses are at each corner node (first at the top surface, then the bottom) and the number of items in this record is 2*nodstr*11. * For layered elements (with KEYOPT(8)=0), stresses for the "first" layer are at each corner node (first at the bottom surface of the bottom layer, then at the top surface of the top layer). Stresses for the "second" layer are at each corner node (first at the bottom surface, then at the top surface for the layer with the largest failure criteria). The number of items in this record is NL*2*nodstr*11, where NL is 2 (for two layers). The second layer isn't present if failure criteria weren't used or aren't appropriate. * For layered elements (with KEYOPT(8)=1), stresses for each layer are at each corner node (first at the bottom surface, then at the top surface) and the number of items in this record is NL*2*nodstr*11, where NL is the number of layers. * For beam elements, the contents and number of data items is element-dependent. See the Output Data section for the particular element in the ANSYS Elements Reference. NOTE: nodstr is defined in the element type description record.
С	ENG	dp	1	11	Element volume and energies.
С					volume, senergy, aenergy, kenergy, coenergy,

С					incenergy,0.0,0.0,thenergy,0.0,0.0
С					each item is described below:
					volume - element volume senergy - element energy associated with the stiffness matrix aenergy - artificial hourglass energy kenergy - kinetic energy coenergy - co-energy (magnetics) incenergy- incremental energy (magnetics) 0.0 - position not used 0.0 - position not used thenergy - thermal dissipation energy (see ThermMat, shell131/132 only) 0.0 - position not used
0 0 0 0 0	EGR	dp	1	varies	Element nodal field gradients. This record contains the gradients at each corner node in the order X,Y,Z. Nodal order corresponds to the connectivity defined in the element description. If this is a
					coupled-field analysis, the data is stored in the following order (as available): fluid, thermal (TEMP), electric (VOLT), and magnetic (AZ). Gradients can be nodal values extrapolated from the integration points or values at the integration points moved to the nodes. See item rxtrap in the solution header for the setting. The number of items in this record is nodstr*3*N, where N can be 1, 2, 3, or 4 (depending on the coupled-field conditions).
c c	EEL	dp	1	varies	NOTE: nodstr is defined in the element type description record. Element nodal component elastic strains.
					This record contains strains in the order X,Y,Z,XY,YZ,XZ,EQV. Elastic strains can be can be nodal values extrapolated from the integration points or values at the integration points moved to the nodes. If an element is nonlinear, integration point values always will be written. See item rxtrap in the solution header for the setting. An element is considered nonlinear when either plastic, creep, or swelling strains are present. For beam elements, see item LEPEL in the description in the Output Data section for the particular element in the ANSYS Elements Reference.
0 0 0 0 0 0	EPL	dp	1	varies	Element nodal component plastic strains. This record contains strains in the order X,Y,Z,XY,YZ,XZ,EQV. Plastic strains are always values at the integration points moved to the nodes. For beam elements, see item LEPPL in the Output Data section for the particular element in the ANSYS Elements Reference.
0 0 0 0 0 0	ECR	dp	1	varies	Element nodal component creep strains. This record contains strains in the order X,Y,Z,XY,YZ,XZ,EQV. Creep strains are always values at the integration points moved to the nodes. For beam elements, see item LEPCR in the Output Data section for the particular element in the ANSYS Elements Reference.

	ETH	dp	1	varies	Element nodal component thermal strains. This record contains strains in the order X,Y,Z,XY,YZ,XZ,EQV plus the element swelling strain. Thermal strains can be nodal values extrapolated from the integration points or values at the integration points moved to the nodes. If the element in nonlinear, integration point data always will be written. (An element is considered nonlinear when either plastic, creep, or swelling strains are present.) See item rxtrap in the solution header for the setting. For beam elements, see item LEPTH in the description of the Output Data section for the particular element in the ANSYS Elements Reference.
C C	EUL	dp	1	varies	Element Euler angles. This record contains the Euler rotations (THXY,THYZ,THZX).
					 * For lower-ordered elements, rotations are at the centroid and the number of items in this record is 3. * For higher-ordered elements, rotations are at each corner node and the number of items in this record is nodstr*3. * For layered shells, rotations are at each corner node, plus the layer rotation angle for each layer (real constant THETA). The number of items in this record is nodstr*3+NL, where NL is the number of layers. * For the layered solid, rotation angles are at the centroid, plus the layer rotation angle for each layer (real constant THETA). The number of items in this record is 3 + NL.
c c					NOTE: nodstr is defined in the element type description record.
	EFX	dp	1	varies	Element nodal field fluxes. This record contains the fluxes at each corner node in the order X,Y,Z. If this is a coupled-field analysis, the flux data is stored in the following order: thermal, electric, magnetic. Nodal order corresponds to the connectivity defined in the element description. Fluxes can be nodal values extrapolated from the integration points or values at the integration points moved to the nodes. See item rxtrap in the solution header for the setting. The number of items in this record is nodstr*3*N, where N can be 1, 2, or 3 depending on the coupled-field conditions.
c c					NOTE: nodstr is defined in the element type description record.
c * c c c c c c c	ELF	dp	1	varies	Element nodal coupled-field forces. This record lists the forces at each node in the order X,Y,Z. For most elements, the number of items in this record is nodfor*3. However, for the PLANE53 element, the number of items in this record is either nodfor*3 or nodstr*3. (See the description of KEYOPT(7) for PLANE53 in the ANSYS Elements Reference.) NOTE: nodfor and nodstr are defined in the element type

С				description record.
C C				NOTE: nodstr is defined in the element type description record.
C EMN C C C	dp	1	varies	Element nonsummable miscellaneous data. The contents and number data items for this record is element-dependent. See the description for item NMISC of the ETABLE command in the ANSYS Commands Reference.
c * ECD c	dp	1	3	Element current densities. This record contains the calculated current densities in the order X,Y,Z.
C ENL C C	dp	1	varies	Element nodal nonlinear data. This record stores nonlinear data at each corner node in the order SEPL, SRAT, HPRES, EPEQ, PSV, PLWK, CRWK, and ELENG followed by 2 spares.
				each item is described below: SEPL - equivalent stress parameter SRAT - stress ratio HPRES - hydrostatic pressure EPEQ - accumulated equivalent plastic strain PSV - plastic state variable PLWK - plastic strain energy density (work) CRWK - creep strain energy density (work) ELENG - elestic strain energy density * For solid elements, the record contains nonlinear data at each corner node and the number of items in this record is nodstr*10. * For shell elements, the record contains nonlinear data at each corner node (first at the top surface, them the bottom surface), and the number of items in this record is 2*nodstr*10. * For layered elements, the record contains nonlinear data at each layer at each corner node (first at the top surface, then the bottom) and the number of items in this record is NL*2*nodstr*10, where NL = number of layers. * For beam elements, the contents and number of data items in this record is element-dependent. See the description of item NLIN in the Output Data section for the particular element in the ANSYS Elements Reference.
C C				NOTE: nodstr is defined in the element type description record.
c * EHC c	dp	1	1	Element heat generation. This record stores the calculated heat generation.
c EPT	dр	1	varies	Element structural nodal temperatures.
c c c c c c c c c c c				* For solid elements and SHELL41, the record contains nodal temperatures at each node and the number of items in this record is nodfor. * For shell elements, except SHELL41 and SHELL91, the record contains nodal temperatures at each corner node for the top surface and the bottom surface. The number of items in this record is nodstr*2. * For SHELL91 and SOLID191, the record contains nodal temperatures at each

```

                    1
                                    uses the reduced method and nbcdsp > 0 (see
C
                                    record at ptrDOF). These numbers are the
С
С
                                   positions in the previous record of dofs with
                                   a nodal constraint. These are nodal
С
С
                                    constraints only on nodes that also are
C
                                   masters.
                                     (na(i), i=1, nbcdsp)
```

C	STF	dp	nmrow	nmrow	Reduced stiffness matrix. Each row of the
С					matrix is stored as a record. The matrix is
C					present only if nmatrx > 0 and analysis is
C					not using mode superposition method (using
C					the subspace mode extraction method). Row
С					order is the same as the DOF order in record
С					at ptrDOF.
					-
С					(ak(i,j),i=1,nmrow)
C	MAS	dp	nmrow	nmrow	Reduced mass matrix. Each row of the matrix
С					is stored as a record. The matrix is present
С					only if nmatrx > 1 and analysis is not using
C					mode superposition method (using the subspace
С					extraction technique). Row order is the same
C					as the DOF order in record at ptrDOF.
C					(am(i,j),i=1,nmrow)
C	DMP	dp	varies	varies	Reduced damping matrix or mode shapes.
С					If the analysis uses the reduced method,
C					each record will be nmrow items in length.
					3
С					The reduced damping matrix is present only
C					if nmatrx > 2. There will be nmrow records of
C					this type stored here. Row order is the same
C					as the DOF order in record at ptrDOF.
					-
С					If the analysis uses the mode superposition
С					method (using the reduced mode extraction
C					technique), each record will be nmode items
					<u> </u>
С					in length. These records contain mode shapes
C					(eigenvectors) of the frequencies
C					(eigenvalues) actually used in the harmonic
C					analysis. There will be nmode records of this
С					type stored here, with the first N records
C					containing the mode shapes and the other
С					records containing zeros, where N is the
C					number of modes actually used in the harmonic
C					analysis. Order corresponds to the DOF order
C					given in record at ptrDOF.
C					If the analysis uses the mode superposition
С					method (using the subspace mode extraction
С					technique), this record will not be present.
C					(psi(i,j),i=1,nmrow) (or ac)
C					(psi(i,j),i-i,imilow) (or ac)
C	FRQ	dp	1	nmrow	Frequencies extracted from the modal
C					analysis. This record is present only if the
C					analysis uses the mode superposition method.
С					The first nmode values are the frequencies
C					extracted from the modal analysis. The
С					remaining values have no meaning.
С					(freq(i),i=1,nmrow)
		_,	_		
C					ated (as a pair) until the time value
C	***	equals the	value of	f timend.	The number of iterations is stored as

                          ngaps
                                    Gap restoring forces. The order of these
                                    forces corresponds to the node position order
C
С
                                    given in record at ptrDNC. This record is
                                    present only if the analysis uses the reduced
C
                                    method and ngaps > 0.
C
                                     (fgaps(i), i=1, ngaps)
```

1.4. Description of the Reduced Complex Displacement File

This section explains the content of the reduced complex displacement file (jobname.rfrq).

1.4.1. Standard ANSYS File Header

See Section 1.1.2: The Standard Header for ANSYS Binary Files for a description of this set. File number (Item 1) is 10.

1.4.2. RFRQ File Format

```
*comdeck,fdrfrq

C
С
        recid tells the identifier for this record. Not all records will have
             identifiers -- they are only indicated for those records whose
             record pointers are stored in the second file header.
C
        type tells what kind of information is stored in this record:
C
             i - integer
C
С
             dp - double precision
C
             cmp - complex
        nrec tells how many records of this description are found here
        lrec tells how long the records are (how many items are stored)
c recid
          type

C C					<pre>the number used for storage. (baclst(i),i=1,lenbac)</pre>
с с		dp	1	10	Unused record. contents: 1.0, 0.0, 0.0, 0.0, 0.0, 0.0, 0.0, 0.0, 0
0 0 0	DOF	i	1	nmrow	Degree of freedom set used The DOFs are calculated as (N-1)*numdof+DOF, where N is the position number of the node in the nodal equivalence table and DOF is the DOF reference number given above.
0 0					If the analysis uses the reduced method, the original DOF order (see next record) is rearranged so that DOFs having nodal constraints are listed first.
0 0 0 0 0					If the analysis uses the mode superposition method (using the reduced mode extraction technique), the DOF order is the same as the original order (see next record). $(l(i),i=1,nmrow)$
0 0 0		i	1	nmrow+1	Original reduced set of DOFs used. The DOFs are calculated as $(N-1)*numdof+DOF$, where N is the position number of the node in the nodal equivalence table and DOF is the DOF reference number given above.
С С					If the analysis uses the reduced method, the original DOF order, plus the number of nodal constraints (nbcdsp), is stored.
0 0 0					If the analysis uses the mode superposition method (using the reduced mode extraction technique), this record matches the previous record. The nmrow+1 entry will be zero. (lorig(i),i=1,nmrow),nbcdsp
	DNC	i	1	nbcdsp	This record is present only if the analysis uses the reduced method and nbcdsp > 0 (see record at ptrDOF). These numbers are the positions in the previous record of dofs with a nodal constraint. These are nodal constraints only on nodes that also are masters. (na(i),i=1,nbcdsp)
0 0 0 0 0 0 0	STF	dp	nmrow	nmrow	Reduced stiffness matrix. Each row of the matrix is stored as a record. The matrix is present only if nmatrx > 0 and analysis is not using mode superposition method (using the subspace mode extraction method). Row order is the same as the DOF order in record at ptrDOF. (ak(i,j),i=1,nmrow)
0 0 0 0 0 0	MAS	dp	nmrow	nmrow	Reduced mass matrix. Each row of the matrix is stored as a record. The matrix is present only if nmatrx > 1 and analysis is not using mode superposition method (using the subspace extraction technique). Row order is the same as the DOF order in record at ptrDOF. $(am(i,j),i=1,nmrow)$
С	DMP	dp	varies	varies	Reduced damping matrix or mode shapes.
c c c					If the analysis uses the reduced method, each record will be nmrow items in length. The reduced damping matrix is present only if nmatrx > 2. There will be nmrow records of

C						
					this type stored here. as the DOF order in rec	
						-
C					If the analysis uses th	e mode superposition
C					method (using the reduc	ed mode extraction
C					technique), each record	will be nmode items
C					in length. These record	s contain mode shapes
C					(eigenvectors) of the f	requencies
C					(eigenvalues) actually	used in the harmonic
C					analysis. There will be	nmode records of this
C					type stored here, with	the first N records
C					containing the mode sha	pes and the other
C					records containing zero	s, where N is the
C					number of modes actuall	y used in the harmonic
C					analysis. Order corresp	onds to the DOF order
С					given in record at ptrD	OF.
С					If the analysis uses th	e mode superposition
C					method (using the subsp	ace mode extraction
C					technique), this record	will not be present.
C					(psi(i,j),i=1,nmrow)	(or ac)
С	FRQ	dp	1	nmrow	Frequencies extracted fr	om the modal analysis.
C					This record is present o	nly for analyses using
C					the mode superposition m	ethod (using the
C					reduced mode extraction	technique).
C					(freq(i),i=1,nmrow)

1.5. Description of the Modal Results File

This section explains the content of the modal results file (**jobname.mode**).

1.5.1. Standard ANSYS File Header

See Section 1.1.2: The Standard Header for ANSYS Binary Files for a description of this set. File number (Item 1) is 9.

1.5.2. MODE File Format

```
*comdeck,fdmode
c *** ansys(r) copyright(c) 2000
```

```
c *** ansys, inc.
      ****** description of modal result file *******
c *** mpg fdmode < modspc romstr lire_freq_mode lire_nb_mode: mode file desc
      character*8 MODENM
      parameter (MODENM='mode
      LONGINT
                     modefpL, modefp
      integer
                     modebk, modeut

                 file unit for file mode
   modeut.
CO
    See fddesc for documentation of how binary files are stored.
C
С
      ****** file format *******
С
         recid tells the identifier for this record. Not all records will have
C
              identifiers -- they are only indicated for those records whose
C
С
              record pointers are stored in the second file header.
         type tells what kind of information is stored in this record:
C
              i - integer
С
              dp - double precision
              cmp - complex
C
         nrec tells how many records of this description are found here
C
         lrec tells how long the records are (how many items are stored)
c recid
                                    contents

c c c		i	1	lenbac	Nodal equivalence table This table equates the number used for storage to the actual node number. (baclst(i),i=1,lenbac)
0 0 0 0 0	RDF	i	1	nmrow	Reduced set of degrees of freedom used. This record is present only if extopt = 0 The DOFs are calculated as (N-1)*NUMDOF+DOF, where N is position number of the node in the nodal equivalence table and DOF is the DOF reference number given above (1(i),i=1,nmrow) (if nmatrx>0)
0 0 0 0 0	FRQ	dp	1	nmode	Frequencies (eigenvalues). Frequencies are complex if extopt=3 or 4. Numbers stored are the squares of the natural circular frequencies (w**2, where w=radians/time). You can obtain the natural frequencies, f (in cycles/time), using the equation f=w/2pi (freq(i),i=1,nmode)
с с	PRT	dp	1	nmode	Participation factors. Factors are complex if EXTOPT=3 or 4. (pfact(i),i=1,nmode)
C C	COF	dp	1	nmode	<pre>Mode coefficients (modecf(i),i=1,nmode)</pre>
c c	DCF	dp	1	nmode	<pre>Modal damping coefficients (dampmd(i),i=1,nmode)</pre>
0 0 0 0 0 0	SHP	dp	nmode	nmrow	Mode shapes (eigenvectors). Mode shapes are complex if extopt=3 or 4. If extopt=0, the mode shape order corresponds to the DOF list stored at position ptrRDF. If extopt does not equal 0, the order corresponds to the nodal equivalence table (psi(i,j),i=1,nmrow)
с с	LOD	dp	1	nmrow	Load vector. This record is present only if extopt=0 or 1. $ (f(i), i \!=\! 1, nmrow) $
C C	IRHS	dp	1	nmrow	<pre>Imaginary Load vector. This record is present only if extopt = 6.</pre>
0 0 0	LPM	dp	1	nmrow	Lumped mass vector. This record is present only if lumpms=1 and nmatrix=0. It is a vector containing the mass at each node in the system. (mass(i),i=1,nmrow)
0 0 0 0	STF	dp	nmrow	nmrow	Reduced stiffness matrix. Each row of the matrix is stored as a record. The matrix is present only if nmatrx > 0. Row order is the same as the DOF order stored at position ptrRDF. (ak(i,j),i=1,nmrow)
c c c c	MAS	dp	nmrow	nmrow	Reduced mass matrix. Each row of the matrix is stored as a record. The matrix is present only if nmatrx > 1. Row order is the same as the DOF order stored at position ptrRDF. (am(i,j),i=1,nmrow)
с с	DMP	dp	nmrow	nmrow	Reduced damping matrix. Each row of the matrix is stored as a record. The matrix is present only if nmatrx > 2. Row order is the

```
same as the DOF order stored at position

C
      ****** file format *******
С
         recid tells the identifier for this record. Not all records will have
C
С
              identifiers -- they are only indicated for those records whose
С
              record pointers are stored in the second file header.
         type tells what kind of information is stored in this record:
              i - integer
C
              dp - double precision
С
              cmp - complex
С
         nrec tells how many records of this description are found here
         lrec tells how long the records are (how many items are stored)

1.7. Description of the Substructure Matrices File

This section explains the contents of the substructure matrices file (**jobname.sub**).

1.7.1. Standard ANSYS File Header

See Section 1.1.2: The Standard Header for ANSYS Binary Files for a description of this set. File number (Item 1) is 8.

1.7.2. SUB File Format

```
*comdeck,fdsub
c *** ansys(r) copyright(c) 2000
c *** ansys, inc
     ****** description of substructure matrix file *******
     character*8 SUBNM
     parameter (SUBNM='sub
                               ')
                    subfpL, lenSubL, subfp
     LONGINT
                    subbk, subut
     common /fdsub/ subfpL, lenSubL, subbk, subut
     equivalence (subfp, subfpL)
c write: matout
  read:
   ******* common variable descriptions ********
С
   subfp
               file position on file sub
               block number for file sub
   subbk
CO
CO
   subut
               file unit for file sub
   lenSub
               length of sub file (saved for slvdta.F)
```

```
See fddesc for documentation of how binary files are stored.
С
C
      ****** file format *******
С
     recid tells the identifier for this record. Not all records will have
C
           identifiers -- they are only indicated for those records whose
C
           record pointers are stored in the second file header.
C
      type tells what kind of information is stored in this record:
C
           i - integer
C
           dp - double precision
C
           cmp - complex
C
C
      nrec tells how many records of this description are found here
      lrec tells how long the records are (how many items are stored)
c recid
                          lrec
                                   contents
           type
                  nrec
                          100
                                   standard ANSYS file header (see binhed

C
С
                               each item in header is described below:
С
                                 fun08 - unit number (sub file is 8)
C
                                nmrow - number of rows in matrices (also
                                        number of dofs in substructure)
С
                                nmatrx - number of matrices on file
                                nedge - number of edges for outline
C
С
                                numdof - number of dofs per node
С
                                maxn - maximum node number of complete
                                        model presently in database
C
                                 wfmax - maximum wavefront of substruct.
С
C
                                        during generation pass
                                 lenbac - number of nodes defining
C
                                         substructure during the
С
С
                                         generation pass
                                nnod - number of unique nodes in the
C
С
                                         substructure having DOFs, and
                                         which define this substructure
C
С
                                         during the use pass. Also, the
С
                                         number of nodes having master
```

C	DOFs.
C	kunsym - unsymmetric matrix key
C	= 0 - symmetric
C	= 1 - unsymmetric
C	kstf - stiffness matrix present key
c	= 0 - matrix is not on file
c	= 1 - matrix is on file
	kmass - mass matrix present key
C	= 0 - matrix is not on file
С	
C	= 1 - matrix is on file
C	=-1 - Lumped mass vestor (Sparse only)
C	kdamp - damping matrix present key
С	= 0 - matrix is not on file
C	= 1 - matrix is on file
С	kss - stress stiffening matrx present
C	= 0 - matrix is not on file
C	= 1 - matrix is on file
C	nvect - number of load vectors
C	(at least 1 is required)
С	nWorkL,H - BCS workspace length (only for
C	bacsub)
C	nTermL,H - Number of terms in sparse matrix
c	lenU1 - length of intermediate transformation
c	vector
С	sesort - DOF set sort key
С	= 0 - numbers are not sorted
C	= 1 - numbers are sorted in
C	ascending order
C	len1st - maximum length of DOF set for
С	this substructure (maxn*numdof)
C	ptrLod - pointer to the start of the load
С	vectors (see also ptrLodh)
C	ntrans - transformed key
С	= 0 - substructure has not been
C	transformed
C	> 0 - substructure copied
c	from another substructure,
	via either SESSYM or SETRAN
C	
С	ptrMtxL,H - pointer to the start of the
C	substructure matrices (iDiagL for
С	sparse matrices)
	sparse matrices) ptrXFM - pointer to the substructure
С	sparse matrices) ptrXFM - pointer to the substructure transformations
c c	sparse matrices) ptrXFM - pointer to the substructure
c c c	sparse matrices) ptrXFM - pointer to the substructure transformations
c c c	sparse matrices) ptrXFM - pointer to the substructure transformations ptrHED - pointer to the SUB file header
c c c c	sparse matrices) ptrXFM - pointer to the substructure transformations ptrHED - pointer to the SUB file header namel - first four characters of the
C C C C	sparse matrices) ptrXFM - pointer to the substructure transformations ptrHED - pointer to the SUB file header namel - first four characters of the substructure file name, in
c c c c c c	sparse matrices) ptrXFM - pointer to the substructure transformations ptrHED - pointer to the SUB file header name1 - first four characters of the substructure file name, in integer form name2 - second four characters of the
C C C C C C C	sparse matrices) ptrXFM - pointer to the substructure transformations ptrHED - pointer to the SUB file header namel - first four characters of the substructure file name, in integer form name2 - second four characters of the substructure file name, in
C C C C C C C	sparse matrices) ptrXFM - pointer to the substructure transformations ptrHED - pointer to the SUB file header namel - first four characters of the substructure file name, in integer form name2 - second four characters of the substructure file name, in integer form
C C C C C C C C C C C C C C C C C C C	sparse matrices) ptrXFM - pointer to the substructure transformations ptrHED - pointer to the SUB file header namel - first four characters of the substructure file name, in integer form name2 - second four characters of the substructure file name, in integer form lrok - large rotation key
C C C C C C C C C C C C C C C C C C C	sparse matrices) ptrXFM - pointer to the substructure transformations ptrHED - pointer to the SUB file header namel - first four characters of the substructure file name, in integer form name2 - second four characters of the substructure file name, in integer form lrok - large rotation key = 0 - DOF set is not valid for
C C C C C C C C C C C C C C C C C C C	sparse matrices) ptrXFM - pointer to the substructure transformations ptrHED - pointer to the SUB file header namel - first four characters of the substructure file name, in integer form name2 - second four characters of the substructure file name, in integer form lrok - large rotation key = 0 - DOF set is not valid for large rotations
	sparse matrices) ptrXFM - pointer to the substructure transformations ptrHED - pointer to the SUB file header name1 - first four characters of the substructure file name, in integer form name2 - second four characters of the substructure file name, in integer form lrok - large rotation key = 0 - DOF set is not valid for large rotations = 1 - DOF set is valid
	sparse matrices) ptrXFM - pointer to the substructure transformations ptrHED - pointer to the SUB file header name1 - first four characters of the substructure file name, in integer form name2 - second four characters of the substructure file name, in integer form lrok - large rotation key = 0 - DOF set is not valid for large rotations = 1 - DOF set is valid trok - SETRAN rotation key
	sparse matrices) ptrXFM - pointer to the substructure transformations ptrHED - pointer to the SUB file header name1 - first four characters of the substructure file name, in integer form name2 - second four characters of the substructure file name, in integer form lrok - large rotation key = 0 - DOF set is not valid for large rotations = 1 - DOF set is valid trok - SETRAN rotation key = 0 - DOF set is not valid for
	sparse matrices) ptrXFM - pointer to the substructure transformations ptrHED - pointer to the SUB file header name1 - first four characters of the substructure file name, in integer form name2 - second four characters of the substructure file name, in integer form lrok - large rotation key = 0 - DOF set is not valid for large rotations = 1 - DOF set is valid trok - SETRAN rotation key = 0 - DOF set is not valid for SETRAN nodal rotation
	sparse matrices) ptrXFM - pointer to the substructure transformations ptrHED - pointer to the SUB file header name1 - first four characters of the substructure file name, in integer form name2 - second four characters of the substructure file name, in integer form lrok - large rotation key = 0 - DOF set is not valid for large rotations = 1 - DOF set is valid trok - SETRAN rotation key = 0 - DOF set is not valid for
	sparse matrices) ptrXFM - pointer to the substructure transformations ptrHED - pointer to the SUB file header name1 - first four characters of the substructure file name, in integer form name2 - second four characters of the substructure file name, in integer form lrok - large rotation key = 0 - DOF set is not valid for large rotations = 1 - DOF set is valid trok - SETRAN rotation key = 0 - DOF set is not valid for SETRAN nodal rotation
	sparse matrices) ptrXFM - pointer to the substructure transformations ptrHED - pointer to the SUB file header namel - first four characters of the substructure file name, in integer form name2 - second four characters of the substructure file name, in integer form lrok - large rotation key = 0 - DOF set is not valid for large rotations = 1 - DOF set is valid trok - SETRAN rotation key = 0 - DOF set is not valid for SETRAN nodal rotation = 1 - DOF set is valid
	sparse matrices) ptrXFM - pointer to the substructure transformations ptrHED - pointer to the SUB file header namel - first four characters of the substructure file name, in integer form name2 - second four characters of the substructure file name, in integer form lrok - large rotation key = 0 - DOF set is not valid for large rotations = 1 - DOF set is valid trok - SETRAN rotation key = 0 - DOF set is not valid for SETRAN nodal rotation = 1 - DOF set is valid name3 - third four characters of the
	sparse matrices) ptrXFM - pointer to the substructure transformations ptrHED - pointer to the SUB file header namel - first four characters of the substructure file name, in integer form name2 - second four characters of the substructure file name, in integer form lrok - large rotation key = 0 - DOF set is not valid for large rotations = 1 - DOF set is valid trok - SETRAN rotation key = 0 - DOF set is not valid for SETRAN nodal rotation = 1 - DOF set is valid name3 - third four characters of the substructure file name, in
	sparse matrices) ptrXFM - pointer to the substructure transformations ptrHED - pointer to the SUB file header namel - first four characters of the substructure file name, in integer form name2 - second four characters of the substructure file name, in integer form lrok - large rotation key = 0 - DOF set is not valid for large rotations = 1 - DOF set is valid trok - SETRAN rotation key = 0 - DOF set is not valid for SETRAN nodal rotation = 1 - DOF set is valid name3 - third four characters of the substructure file name, in integer form name4 - fourth four characters of the
	sparse matrices) ptrXFM - pointer to the substructure transformations ptrHED - pointer to the SUB file header namel - first four characters of the substructure file name, in integer form name2 - second four characters of the substructure file name, in integer form lrok - large rotation key = 0 - DOF set is not valid for large rotations = 1 - DOF set is valid trok - SETRAN rotation key = 0 - DOF set is not valid for SETRAN nodal rotation = 1 - DOF set is valid name3 - third four characters of the substructure file name, in integer form name4 - fourth four characters of the substructure file name, in
	sparse matrices) ptrXFM - pointer to the substructure transformations ptrHED - pointer to the SUB file header namel - first four characters of the substructure file name, in integer form name2 - second four characters of the substructure file name, in integer form lrok - large rotation key = 0 - DOF set is not valid for large rotations = 1 - DOF set is valid trok - SETRAN rotation key = 0 - DOF set is not valid for SETRAN nodal rotation = 1 - DOF set is valid name3 - third four characters of the substructure file name, in integer form name4 - fourth four characters of the substructure file name, in integer form
	sparse matrices) ptrXFM - pointer to the substructure transformations ptrHED - pointer to the SUB file header namel - first four characters of the substructure file name, in integer form name2 - second four characters of the substructure file name, in integer form lrok - large rotation key = 0 - DOF set is not valid for large rotations = 1 - DOF set is valid trok - SETRAN rotation key = 0 - DOF set is not valid for SETRAN nodal rotation = 1 - DOF set is valid name3 - third four characters of the substructure file name, in integer form name4 - fourth four characters of the substructure file name, in integer form ptrDOF - pointer to the DOF/node list
	sparse matrices) ptrXFM - pointer to the substructure transformations ptrHED - pointer to the SUB file header name1 - first four characters of the substructure file name, in integer form name2 - second four characters of the substructure file name, in integer form lrok - large rotation key = 0 - DOF set is not valid for large rotations = 1 - DOF set is valid trok - SETRAN rotation key = 0 - DOF set is not valid for SETRAN nodal rotation = 1 - DOF set is valid name3 - third four characters of the substructure file name, in integer form name4 - fourth four characters of the substructure file name, in integer form ptrDOF - pointer to the DOF/node list ptrDST - pointer to the local DOF set
	sparse matrices) ptrXFM - pointer to the substructure transformations ptrHED - pointer to the SUB file header name1 - first four characters of the substructure file name, in integer form name2 - second four characters of the substructure file name, in integer form lrok - large rotation key = 0 - DOF set is not valid for large rotations = 1 - DOF set is valid trok - SETRAN rotation key = 0 - DOF set is not valid for SETRAN nodal rotation = 1 - DOF set is valid name3 - third four characters of the substructure file name, in integer form name4 - fourth four characters of the substructure file name, in integer form ptrDOF - pointer to the DOF/node list ptrDST - pointer to the nodes comprising
	sparse matrices) ptrXFM - pointer to the substructure transformations ptrHED - pointer to the SUB file header name1 - first four characters of the substructure file name, in integer form name2 - second four characters of the substructure file name, in integer form lrok - large rotation key
	sparse matrices) ptrXFM - pointer to the substructure transformations ptrHED - pointer to the SUB file header namel - first four characters of the substructure file name, in integer form name2 - second four characters of the substructure file name, in integer form lrok - large rotation key
	sparse matrices) ptrXFM - pointer to the substructure transformations ptrHED - pointer to the SUB file header name1 - first four characters of the substructure file name, in integer form name2 - second four characters of the substructure file name, in integer form lrok - large rotation key = 0 - DOF set is not valid for large rotations = 1 - DOF set is valid trok - SETRAN rotation key = 0 - DOF set is not valid for SETRAN nodal rotation = 1 - DOF set is valid name3 - third four characters of the substructure file name, in integer form name4 - fourth four characters of the substructure file name, in integer form ptrDOF - pointer to the DOF/node list ptrDST - pointer to the local DOF set ptrBAC - pointer to the nodes comprising the substructure ptrTIT - pointer to the title ptrNOD - pointer to the unique nodes
	sparse matrices) ptrXFM - pointer to the substructure transformations ptrHED - pointer to the SUB file header name1 - first four characters of the substructure file name, in integer form name2 - second four characters of the substructure file name, in integer form lrok - large rotation key
	sparse matrices) ptrXFM - pointer to the substructure transformations ptrHED - pointer to the SUB file header name1 - first four characters of the substructure file name, in integer form name2 - second four characters of the substructure file name, in integer form lrok - large rotation key = 0 - DOF set is not valid for large rotations = 1 - DOF set is valid trok - SETRAN rotation key = 0 - DOF set is not valid for SETRAN nodal rotation = 1 - DOF set is valid name3 - third four characters of the substructure file name, in integer form name4 - fourth four characters of the substructure file name, in integer form ptrDOF - pointer to the DOF/node list ptrDST - pointer to the local DOF set ptrBAC - pointer to the nodes comprising the substructure ptrTIT - pointer to the title ptrNOD - pointer to the unique nodes

```
С
                                            unique nodes
С
                                  ptrEDG - pointer to the substructure edges
С
                                  ptrGDF - pointer to the global DOF set
C
                                   thsubs - thermal key

                                      (baclst(i), i=1, lenbac)
C
         At this point in the file, the triangularized matrix information is
С
С
         stored. The info is written row by row, and there are two different
         storage options for writing a row. If the row being written does not
C
         have a constraint equation associated with it, then two records are
C
         written to describe the row. If the row being written has a constraint
C
         equation associated with it, then five records are written to describe
С
С
         the row. Both formats are shown below. These groupings of two or five
         records per row will be written a total of nontp times (to include all
C
C
  The next two descriptions show the format for a row that does not have a
С
   constraint equation associated with it:
С
C
C
         dp/cmp
                          varies
                                    A row of the triangularized matrix.
С
                                     If keyuns=0, this record will contain the
C
С
                                     non-diagonal terms of this column, the
                                     diagonal term itself, the normalized F
С
                                     term, followed by the reciprocal of the row
C
С
                                     pivot.
С
С
                                     If keyuns=1, this record will contain the
С

        If fun04 < 0, then the file was created with symbolic assembly; see below
С
                      for its format
  ----- frontal assembled file -----
                                   each item in header is described below:
C
                                    fun04 - unit number (full file is 4)
C
                                   negn - number of equations on file
C
                                   nmrow - number of rows in matrices
С
                                   nmatrx - number of matrices on file
C
                                          - analysis type
C
                                   kan
                                    wfmax - maximum wavefront
С
                                   lenbac - number of nodes
С
                                   numdof - number of dofs per node
C
С
                                    jcgtrmL,jcgtrmH - number of coefficients
C
                                    lumpm - lumped mass key
                                            = 0 - default matrix type
= 1 - lumped
С
С
```

```
jcgeqn - number of jcg equations
C
                                     jcgtrm - pre-8.1 this is the number of
С
С
                                             coefficients in sparse jcg
                                             storage (otherwise this value
C
                                             must be 0 and jcgtrmL, jcgtermH
С
С
                                             must be used)
                                    keyuns - unsymmetric key
С
С
                                              = 0 - no unsymmetric matrices on
C
                                                    file
C
                                             = 1 - there is at least one
                                                    unsymmetric matrix on file
C
                                    extopt - mode extraction method
С
                                             = 0 - reduced
С
С
                                              = 1 - lumped
                                             = 3 - unsymmetric Lanczos
C
                                              = 4 - damped Lanczos
С
                                             = 6 - block Lanczos
С
                                    keyse - superelement key; set if at least
C
С
                                             one superelement
                                    sclstf - scale factor for matrices
C
                                    nxrows - the maximum rank for this solution
C
                                    ptrIDX1- pointer to the matrix row indices.
С
                                    ptrIDXh- high part of row index pointer
С
                                    ncefull- Number of constraint equations on
С
С
                                             the full file
                                    ncetrm - Total number of terms in the
C
С
                                             constraint equations
                                    ptrENDl- Low part of 64 bit end of file ptr
С
                                    ptrENDh- High part of 64 bit end of file ptr
C
                                           - position not used
            i
                           numdof
                                    Degrees of freedom per node
C
С
                                    DOF reference numbers are:
          UX = 1, UY = 2, UZ = 3, ROTX= 4, ROTY= 5, ROTZ= 6, AX = 7, AY = 8
C
С
          AZ = 9, VX =10, VY =11, VZ =12 ***** 13-18 are spares ********
          *****
                            PRES=19, TEMP=20, VOLT=21, MAG =22, ENKE=23, ENDS=24
C

C
С
                                     (curdof(i),i=1,numdof)
                                    Nodal equivalence table. This table equates
C
            i
                           lenbac
                                    the number used for storage to the actual
С
С
                                    node number
C
                                     (baclst(i), i=1, lenbac)
  NOTE: The next five records are repeated as a group neqn times.
   When the matrices get written, one row of each matrix is written to the file
C
    at a time. i.e. the first row of each matrix is written, then the second row
    of each matrix, etc. this pattern continues until all the rows of each
С
    matrix have been written to the file. If kan=3, the matrix rows will be
    complex valued, otherwise they will be double precision values.
            i
С
   IDX
                    1
                           varies
                                    Matrix row indices. The first
                                    item signifies what term in the row belongs
C
С
                                     to the pivot. The second term signifies what
C
                                    DOF is being eliminated, and the remaining
                                    items signify the new DOFs being introduced
С
С
                                     (if any). The length of this record will
C
                                    vary (actual length is returned from routine
C
                                    BINRD8)
                                     (111(i), i=1, m)
С
                                    A second level of indexing for the
C
                           varies
                                    matrix. Indicates positions and
C
                                    values of terms to be reduced. The length of
C
                                     this record will vary (actual length is
C
                                    returned from routine BINRD8)
С
                                     (index(i),i=1,n) for compressed rows
C
                                    Stiffness matrix.
         dp/cmp
                    1
                           varies
C
С
                                    If keyuns=0, this record will contain the
```

```
non-diagonal terms of this column, the
C
                                     diagonal term itself, followed by the
С
                                     normalized F term.
С
                                    If keyuns=1, this record will contain the
С
С
                                     non-diagonal terms of this column, the
                                     diagonal term itself, the non-diagonal terms
C
C
                                     of this row, followed by the normalized F
C
                                     term.
                                    If lumpm = 1, then the mass for this node is
С
                                    located after the F term. The length of
С
                                    this record will vary (actual length is
С
С

Chapter 2: Accessing Binary Data Files

2.1. Accessing ANSYS Binary Files

The following section explains the routines you need to read, write, or modify an ANSYS binary file. This collection of routines (called BINLIB) resides on your ANSYS distribution media. The BINLIB library is in the dynamic link library \Program Files\Ansys Inc\V100\ANSYS\custom\misc\<platform>\binlib.dll (on Windows systems (where <platform> is a directory that uniquely identifies the hardware platform version)) or the shared library /ansys_inc/v100/ansys/customize/misc/<platform>/libbin.so on UNIX systems (libbin.sl on HP systems).

Your distribution media also includes sample FORTRAN source files which employ the BINLIB library:

bintrd.F	The bintrd subroutine reads and prints the contents of an ANSYS binary file				
bintwr.F The bintwr subroutine copies an ANSYS binary file to a new file					
bintst.F	The bintst program calls the bintwr and bintrd subroutines as an example of how to use the binlib library to print the contents of a file, copy the original file to a new file, and then print the contents of the new file. Routine bintst has no inputs or outputs. It requires use of the bintcm common. (For more information, see the descriptions of the bintrd and bintwr routines later in this chapter.)				

These files reside in the subdirectory \Program Files\Ansys Inc\V100\ANSYS\custom\misc\<platform> (on Windows systems) or /ansys_inc/v100/ansys/customize/misc (on UNIX systems). To compile and link the BINTST program, a makefile procedure has been provided in the \Program Files\Ansys Inc\V100\ANSYS\custom\misc\<platform> subdirectory on windows or run the bintst.link procedure in the /ansys_inc/v100/ansys/customize/misc subdirectory on UNIX.

2.1.1. Access Routines to Results and Substructure Files

Demonstration programs for reading and writing ANSYS results and substructure files are included on the installation media:

- ResRdDemo
- ResWrDemo
- rdsubs
- wrtsub
- rdfull

On Windows systems:

The FORTRAN source for these programs is located in \Program Files\Ansys Inc\V100\ANSYS\custom\misc and the files are named ResRdDemo.F, ResWrDemo.F, rdsubs.F, wrtsub.F, and rdfull.F.

To link these demonstration programs, use the \Program Files\Ansys Inc\V100\ANSYS\custom\misc\<platform>\rdrwrt.bat procedure file and specify the program that you want to build on the command line. Valid command line options are ResRdDemo, ResWrDemo, rdsubs, wrtsub, rdfull, and userprog. For example, to build the program to read a results file, type:

Appropriate files will then be copied from \Program Files\Ansys Inc\V100\ANSYS\custom\misc\<platform> to your working directory, compiled, and linked. The resulting executable will also be placed in your current working directory.

Use the userprog command line option when writing your own customized program, naming the routine **userprog.F**. The resulting executable will be named **userprog.exe**. When userprog is used, no files are copied from **\Program Files\Ansys Inc\V100\ANSYS\custom\misc**?platform> to your working directory.

These files will be loaded onto your system only if you performed a custom installation and chose to install the customization tools.

On UNIX systems:

The FORTRAN source for these programs is located in /ansys_inc/v100/ansys/custom/misc and the files are named ResRdDemo.F, ResWrDemo.F, rdsubs.F, wrtsub.F, and rdfull.F.

To link these demonstration programs, use the /ansys_inc/v100/ansys/customize/misc/rdrwrt.link procedure file and specify the program that you want to build on the command line. Valid command line options are Res-RdDemo, ResWrDemo, rdsubs, wrtsub, rdfull, and userprog. For example, to build the program to read a results file, type:

/ansys_inc/v100/ansys/customize/misc/rdrwrt.link ResRdDemo

Appropriate files will then be copied from /ansys_inc/v100/ansys/customize/misc to your working directory, compiled, and linked. The resulting executable will also be placed in your current working directory. Procedure files are available in the /ansys_inc/v100/ansys/bin directory to run these programs, once linked. The procedure files are named ResRdDemo100, ResWrDemo100, rdsubs100, wrtsub100, and rdfull100.

Use the userprog command line option when writing your own customized program, naming the routine **userprog.F**. The resulting executable will be named **userprog.e100**. When userprog is used, no files are copied from **/ansys_inc/v100/ansys/customize/misc** to your working directory. The procedure file is named userprog100.

These files will be loaded onto your system only if you performed a custom installation and chose to install the customization tools.

2.1.2. Characteristics of ANSYS Binary Files

Before accessing ANSYS binary files, you need to know certain file characteristics:

- 1. An ANSYS binary file is a direct access, unformatted file. You read or write a record by specifying (as a number) what location to read or write.
- Before the ANSYS program actually writes data to a file on a disk, it uses buffers to store data in memory until those buffers become full. A block number designates these buffers. Most access routines use this block number.
- 3. By default, ANSYS files are external files. The standardized "external" format the files use enables you to transport them across different computer systems.
- 4. In addition to file names, ANSYS uses file numbers to identify the files. File handles and other information are associated with the file numbers.
- 5. Some binary files contain data values that point to the start of certain data (for example, the start of the data steps index table record). Both the ANSYS program and external binary files access routines use these pointers to locate data on the various binary files.

6. All data is written out as 32-bit integers. Double-precision data and pointers, therefore, take up two integer words. To create a 64-bit pointer from the two 32-bit integers, use the function largeIntGet.

2.1.3. Viewing Binary File Contents

To view the contents of certain ANSYS binary files, you issue the command /AUX2 or choose menu path Utility Menu>File>List>Binary Files or Utility Menu>List>File>Binary Files. (You can do so only at the Begin level.) The ANSYS program then enters its binary file dumping processor, AUX2, and dumps the binary file record by record.

AUX2 does not use the data pointers discussed in item 5 above. It uses record numbers to locate the binary file data to dump. Although the information that AUX2 provides includes the pointer, using the pointer alone will not get you that information. To get it, you must correlate the pointer and the record number by trial and error.

2.1.4. Abbreviations

The input and output for the routines discussed in this chapter are described with the following abbreviations:

Type of variable is one of the following:

```
int - integer
dp - double-precision
log - logical (true or false)
char - character
```

• *Size* of variable is one of the following:

```
sc - scalar variable ar(n) - array of size n
```

• *Intent* of variable is one of the following:

```
in - input onlyout - output onlyinout - both an input and an output variable
```

2.1.5. binini (Initializing Buffered Binary I/O Systems)

```
*deck,binini
subroutine binini (iott)

c *** primary function: initialize buffered binary i/o system

c --- This routine is intended to be used in standalone programs.

c --- This routine should not be linked into the ANSYS program.

c *** Notice - This file contains ANSYS Confidential information ***

c input arguments:
    iott (int,sc,in) - output unit number for error output

c output arguments: none
```

2.1.6. Function sysiqr (Retrieving the Status of a File)

```
*deck,sysiqr
     function sysiqr (nunit,fname,lname_in,inqr_in)

c *** primary function: do a file system inquire (system dependent)
```

```
c *** Notice - This file contains ANSYS Confidential information ***
 input arguments:
                               description
    variable (typ,siz,intent)
C
                               - fortran unit number (used only for ingr='0')

С
                             as integers, use as is. if ivect is to be
                             used for double precision numbers, it must be
C
                             increased by multiplying it by INTPDP.
С
    ivect (int,ar(*),in) - data to be written onto the file(can be either
С
                             integer or double precision in the calling
C
                             routine)
                          - key for type(used only for AUX2 dump)
С
   kbfint (int,sc,in)
С
                            = 0 double precision data
                            > 0 integer data(usually the same as leng)
    Buffer4 (int,ar(*),inout) - work array for paging, should be the
C
С
                                    same array as used in binset on this
С
                                    block
```

```
c output arguments:
c LongLocL(LONG,sc,inout) - location in integer words of the current
c position on the file. It is updated after
c each write operation
c ivect (int,ar(*),out) - vector containing record to be written
c Buffer4 (int,ar(*),inout) - work array for paging
```

Versions of **binrd8/binwrt8** exist without the "8" suffix (**binrd/binwrt**) that take a regular integer for the second argument. These subroutines, therefore, cannot address large files where the file position exceeds 2**31. Use the **binrd8/binwrt8** versions for any new programs.

2.1.13. Subroutine exinc4 (Decoding an Integer String into a Character String)

```
*deck.exinc4
     subroutine exinc4 (ichext,chin,n)
c primary function: decode externally formatted integer versions of 4-character
                   strings to plain 4-character strings (used to convert data
                   from externally formatted files to data for interally
                   formatted files)
С
С
c *** Notice - This file contains ANSYS Confidential information ***
C
  input arguments:
С
С
    ichext
             (int,ar(n),in) - externally formatted integer form of
                                   4-character strings
C
C
               (int,sc,in)
                                 - number of strings to convert
c output arguments:
             (char,ar(n),out) - strings in character form
```

2.1.14. Subroutine inexc4 (Coding a Character String into an Integer String)

```
*deck,inexc4
     subroutine inexc4 (chin,ichext,n)
c primary function: encode plain 4-character strings into externally formatted
                   integer versions of 4-character strings (used to convert
                   data from internally formatted files to data for
C
                   externally formatted files)
С
c *** Notice - This file contains ANSYS Confidential information ***
C
  input arguments:
С
    chin (char,ar(n),out) - strings in character form
                                 - number of strings to convert
               (int,sc,in)
c output arguments:
    ichext (int,ar(n),in) - externally formatted integer form of
                                   4-character strings
C
```

2.1.15. Subroutine binclo (Closing or Deleting a Blocked Binary File)

2.1.16. Subroutine largeIntGet (Converting Two Integers into a Pointer)

2.2. Demonstration Routines

The demonstration routines demonstrate several ways to use the binary file access routines provided with ANSYS. The programs described below (all available on your distribution media; see Section 2.1: Accessing ANSYS Binary Files for their location) demonstrate other tasks that the binary access routines can do.

2.2.1. Program bintst (Demonstrates Dumping a Binary File and Copying It for Comparison Purposes)

The bintst program dumps a binary file with the name **file.rst** to the screen. It then takes that file, copies it to a new file, **file2.rst**, and dumps the new file to the screen for comparison purposes.

2.2.1.1. Common Variables:

Variable	Type, Size, Intent	Description
iout	int, sc, comm	The output unit number
intpdp	int, sc, comm	The number of integers per double precision word
lenfrm	int, sc, comm	The number of characters in the filename
reclng	int, sc, comm	The system record length

Note — The bintst program is not part of the **binlib.a** library. It is included here only to aid you.

2.2.2. Subroutine bintrd (Demonstrates Printing a Dump of File Contents)

```
c *** ansys(r) copyright(c) 2000
c *** ansys, inc.
     typ=int,dp,log,chr,dcp siz=sc,ar(n) intent=in,out,inout
C
С
C
  input arguments:
    variable (typ, siz, intent) description
C
С
     pname
            (chr,sc,in)
                                - name of binary file which is to
                                  be dumped to the screen
С
C
С
  output arguments:
С
     none.
C
 common variables:
                                - output unit number
C
    iout
           (int,sc,comm)
                                - number of integers per double precision word
С
     intpdp
               (int,sc,comm)
                               - number of characters in the filename
    lenfnm
              (int,sc,comm)
C
     reclng (int,sc,comm)
                               - system record length
С
                          NOTE: bintrd is not part of binlib.a. it is
С
                                included only as an aid to users.
C
```

Note — The bintrd routine and the bintwr routine described below are not part of **binlib.a**. This chapter includes it only to aid you. You can find the source for this routine on the ANSYS distribution media.

Both subroutines require the following common:

```
COMMON/BINTCM/ IOUT, INTPDP, LENFNM, RECLNG
```

- *Iout* is the output unit number.
- Intpdp is the number of integers per double precision word.
- Lenf nm is the number of characters in the filename.
- Reclng is the system record length.

2.2.3. Subroutine bintwr (Demonstrates Copying Binary File Contents)

```
*deck.bintwr
     subroutine bintwr (pname, nname)
c *** primary function: bin file copy utility
C
c *** Notice - This file contains ANSYS Confidential information ***
С
c *** ansys(r) copyright(c) 2000
c *** ansys, inc.
С
     typ=int,dp,log,chr,dcp siz=sc,ar(n) intent=in,out,inout
C
  input arguments:
C
С
    variable (typ,siz,intent)
                                description
     pname
               (chr,sc,in)
                                - name of binary file which is to be copied
C
C
 output arguments:
С
    variable (typ,siz,intent) description
                                - name of new binary file which is a copy
    nname (chr,sc,out)
C
С
                                  of pname
  common variables:
С
    iout
           (int,sc,comm)
                               - output unit number
C
    intpdp
             (int,sc,comm)
                                - number of integers per double precision word
    lenfnm
             (int,sc,comm)
                                - number of characters in the filename
C
С
    reclng
             (int,sc,comm)
                                - system record length
                          NOTE: bintwr is not part of binlib.a. it is
C
                                included only as an aid to users.
С
```

2.2.4. Program wrtsub (Demonstrates Writing an ANSYS Substructure File)

2.2.5. Program rdsubs (Demonstrates Reading a Substructure File)

Subroutine rdsubs demonstrates how you read an ANSYS substructure file. This demonstration program can handle up to MAXNODE nodes and MAXDOF degrees of freedom.

2.2.6. Program rdfull (Demonstrates Reading and Reformatting the .FULL File)

Program rdfull demonstrates how to read and reformat the .FULL file. ANSYS writes the full file if the PSOLVE,ELFORM, PSOLVE,ELPREP, PSOLVE,TRIANG sequence is used. You can also use the WRFULL command.

If you want to use the free stiffness and mass matrices, make sure that there are no constraints on your model.

```
*deck,rdfull
     program rdfull
c *** primary function:
                          demonstrates use of binary access routines
c *** secondary function: Read and reformat full file
c *** ansys(r) copyright(c) 2000
c *** ansys, inc.
C
c NOTICE - A new assembly process, termed 'symbolic assembly', has
           replaced the old assembly process, termed 'frontal
C
С
            assembly', and is now the default assembly process for
            most analyses. This program demonstrates how to read
            and reformat the .FULL file that was created using
C
C
            frontal assembly or symbolic assembly. ANSYS writes the
С
            .FULL file if the PSOLVE, ELFORM
                              PSOLVE, ELPREP
С
                              PSOLVE, TRIANG
```

```
sequence is used. ANSYS will also write the .FULL file
С
            when the sparse, ICCG, or JCG solver is used, as well as
С
            when most mode extraction methods are used.
С
C
   Be sure to set up for modal ANTYPE, 2
С
    and full subspace
                                  MODOPT, SUBSP, nmode, 0, 0, , OFF
       (nmode is not used - it can be any value
C
      If the free-free stiffness and mass matrices are desired,
С
         make sure there are no constraints on the model.
```

2.2.7. Program ResRdDemo (Demonstrates Reading a Results File)

Program ResRdDemo demonstrates how to read a results file using the results file access routines. The file must be named **test.rst** and the file contents are written to the screen.

This file resides in the subdirectory \Program Files\Ansys Inc\V100\ANSYS\custom\misc\<platform> (on Windows systems) or /ansys_inc/v100/ansys/customize/misc (on UNIX systems).

2.2.8. Program ResWrDemo (Demonstrates Writing a Results File)

Program ResWrDemo demonstrates how to write an ANSYS-readable results file. This file resides in the subdirectory \Program Files\Ansys Inc\V100\ANSYS\custom\misc\<platform> (on Windows systems) or /ansys inc/v100/ansys/customize/misc (on UNIX systems).

2.3. Results File Access Routines

You can use the low-level routines in described in Section 2.1: Accessing ANSYS Binary Files to retrieve data from the results file. Alternatively, you can use the routines described in this section that retrieve the data specific to the format of the results file. These routines are included on the installation CD (compressed); you can install them on your system by performing a custom installation (as described in the ANSYS Installation and Configuration Guide for your platform).

These files reside in the subdirectory \Program Files\Ansys Inc\V100\ANSYS\custom\misc\<platform> (on Windows systems) or /ansys_inc/v100/ansys/customize/misc (on UNIX systems). See Section 2.1.1: Access Routines to Results and Substructure Files for information on compiling and linking these routines.

2.3.1. Overview of the Routines

For each data record in the results file, routines exist that:

- Read the record index and allocate space for the data. These are named ResRdrecordBegin, where record is a descriptive name of the record, e.g., ResRdNodeBegin
- Read the data itself. These are named ResRdrecord, e.g., ResRdNode
- Deallocate space for the data. These are named ResRdrecordEnd, e.g., ResRdNodeEnd

Below is a complete listing of all the routines with the indentation indicating the required nested calling sequence:

```
function ResRdBegin (Nunit,Lunit,Fname,ncFname,Title,JobName,
    subroutine ResRdGeomBegin (MaxType,MaxReal,MaxCsys)
    subroutine ResRdTypeBegin (NumType)
        function ResRdType (itype,ielc)
    subroutine ResRdTypeEnd
    subroutine ResRdRealBegin (NumReal,NumPerReal)
        function ResRdReal (iReal,Rcon)
    subroutine ResRdRealEnd
    subroutine ResRdCsysBegin (NumCsys)
        function ResRdCsys (iCsys,Csys)
```

```
subroutine ResRdCsysEnd
   subroutine ResRdNodeBegin
     function ResRdNode (iNode, xyzang)
    subroutine ResRdNodeEnd
    subroutine ResRdElemBegin
      function ResRdElem (iElem, nodes, ElemData)
   subroutine ResRdElemEnd
 subroutine ResRdGeomEnd
 function ResRdSolBegin (key, lstep, substep, ncumit, kcmplx, time,
   subroutine ResRdDispBegin
      function ResRdDisp (node,Disp)
    subroutine ResRdDispEnd
   subroutine ResRdRforBegin (nRForce)
      function ResRdRfor (node,idof,value)
    subroutine ResRdRforEnd
    subroutine ResRdBCBegin (BCHeader)
      subroutine ResRdFixBegin (BCHeader,nFixed)
        function ResRdFix (node,idof,value)
      subroutine ResRdFixEnd
      subroutine ResRdForcBegin (BCHeader,nForces)
       function ResRdForc (node,idof,value)
      subroutine ResRdForcEnd
    subroutine ResRdBCEnd
    subroutine ResRdEresBegin
      function ResRdEstrBegin
                               (iElem)
        function ResRdEstr (iStr.Str)
      subroutine ResRdEstrEnd
    subroutine ResRdEresEnd
 subroutine ResRdSolEnd
subroutine ResRdEnd
```

These routines are contained in the file **ResRd.F**. See the demonstration routine **ResRdDemo.F** on the distribution medium for an example of the usage of these routines.

The memory allocation scheme is described in Memory Management Routines in the *Guide to ANSYS User Programmable Features*.

The following sections describe the data-reading routines. See the file **ResRd.F** and its corresponding include deck **ResRd.inc** for listings of the corresponding Begin/End routines.

2.3.2. ResRdBegin (Opening the File and Retrieving Global Information)

```
*deck,ResRdBegin
     function ResRdBegin (Nunit, Lunit, Fname, ncFname, Title, JobName,
                          Units, NumDOF, DOF, UserCode,
                          MaxNode, NumNode, MaxElem, NumElem,
     х
                          MaxResultSet, NumResultSet)
                      Open result file and return global information
c primary function:
c object/library: ResRd
  input arguments:
                             Fortran Unit number for file (ANSYS uses 12)Current print output unit (usually 6 <STDOUT>)
    Nunit (int,sc,in)
C
C
              (int.sc.in)
C
     Fname
              (ch*(ncFname),sc,in) - The name (with extension) for the file
     ncFname (int.sc.in)
                                - Number of characters in Fname
C
c output arguments:
   Title (ch*80,ar(2),out) - Title and First subtitle
C
С
     JobName (ch*8,sc,out) - Jobname from file
     Units (int,sc,out)
                                - 0, unknown 1, SI 2, CSG
С
С
                                  3, U.S. Customary - foot
                                   4, U.S. Customary - inch
С
                                  6, MPA
C
C
    NumDOF (int,sc,out)
                                - Number of DOF per node
С
    DOF (int,ar(*),out) - The DOFs per node
     UserCode (int,sc,out)
                                - Code for this application
C
     MaxNode (int,sc,out)
                                - Maximum node number used
С
```

```
c NumNode (int,sc,out) - Number of nodes used
c MaxElem (int,sc,out) - Maximum element number used
c NumElem (int,sc,out) - Number of elements used
c MaxResultSet (int,sc,out) - Maximum number of result sets (usually 1000)
c NumResultSet (int,sc,out) - Number of result sets on file
c ResRdBegin (int,sc,out) - 0, successful other, error in file open
```

2.3.3. ResRdGeomBegin (Retrieving Global Geometry Information)

2.3.4. ResRdType (Retrieving Element Types)

2.3.5. ResRdReal (Retrieving Real Constants)

```
*deck,ResRdReal
     function ResRdReal (iReal,Rcon)
c primary function: Read real constant record

c object/library: ResRd

c input arguments:
     iReal (int,sc,in) - Real set number

c output arguments: none
c Rcon (dp,ar(ResRdReal),out) - Real Constants
c ResRdReal (int,sc,out) - Number of real constants in set
```

2.3.6. ResRdCsys (Retrieving Coordinate Systems)

```
*deck,ResRdCsys
    function ResRdCsys (iCsys,Csys)
c primary function: Read a coordinate system record

c object/library: ResRd

c input arguments:
    iCsys (int,sc,in) - Coordinate system number

c output arguments:
    Csys (dp,ar(ResRdCsys),out) - Coordinate system description
```

```
c ResRdCsys (int,sc,out) - Number of values
c output arguments:
```

2.3.7. ResRdNode (Retrieving Nodal Coordinates)

```
*deck,ResRdNode
     function ResRdNode (iNode, xyzang)
c primary function:
                     Get a node
c object/library: ResRd
c input arguments:
C
     iNode
            (int,sc,in)
                               - Node number
c output arguments:
С
     xyzanq
              (dp,ar(6),out) - x,y,z,thxy,thyz,thzx for node
     ResRdNode (int,sc,out)
                               - >0, node exists
```

2.3.8. ResRdElem (Retrieving Elements)

```
*deck.ResRdElem
      function ResRdElem (iElem, nodes, ElemData)
c primary function: Read an element
c object/library: ResRd
c input arguments:
     iElem
              (int,sc,in)
                                 - The element number
  output arguments:
С
С
     ResRdElem(int,sc,out)
                                 - Number of nodes
     nodes (int,ar(n),out) - Element nodes
C
     ElemData (int,ar(10),out) - Element information
                                     mat
                                            - material reference number
С
                                           element type numberreal constant reference number
C
                                     type
C
                                     elnum - element number
C
                                           - element coordinate system
С
                                     esys
                                     death - death flag
C
                                              = 0 - alive
                                              = 1 - dead
С
                                     solidm - solid model reference
C
                                     shape - coded shape key
C
С
                                     pexcl - P-Method exclude key
                                            - Not used
```

2.3.9. ResRdSolBegin (Retrieving Result Set Location)

```
*deck,ResRdSolBegin
     function ResRdSolBegin (key, lstep, substep, ncumit, kcmplx, time,
                             Title, DofLab)
c primary function:
                      Read the solution header records
c object/library: ResRd
 input arguments:
                                - 1, find by lstep/substep
С
     key (int,sc,in)
С
                                  2, find by ncumit
                                  3, find by time
C
              (int,sc,in/out)
                               - Load step number
C
     lstep
C
     substep (int,sc,in/out)
                               - Substep of this load step
     ncumit (int,sc,in/out)
                               - Cumulative iteration number
С
     kcmplx (int,sc,in)
                                - 0, Real solution 1, Imaginary solution
С
     time
              (int,sc,in/out)
                               - Current solution time
C
c output arguments:
```

```
c Title (ch*80,ar(5),out) - Title and 4 subtitles
c DofLab (ch*4,ar(nDOF),out) - Labels for DOFs
c ResRdSolBegin (int,sc,out) - 0, requested solution set found
c 1, not found
```

2.3.10. ResRdDisp (Retrieving Nodal Solution)

```
*deck,ResRdDisp
    function ResRdDisp (node,Disp)
c primary function: Retrieve a nodal displacement

c object/library: ResRd

c input arguments:
    node (int,sc,in) - Node number

c output arguments: none
    Disp (dp,ar(nDOF),out) - Displacements
    ResRdDisp(int,sc,out) - Number of displacements
```

2.3.11. ResRdRfor (Retrieving Reaction Solution)

2.3.12. ResRdFix (Retrieving Applied Nodal Constraints)

```
*deck,ResRdFix
     function ResRdFix (node,idof,value)
c primary function: Retrieve a constraint value
c object/library: ResRd
С
  input arguments:
    node (int,sc,in)
                              - External node number
C
             (int,sc,in)
                               - Internal dof number
 output arguments:
C
     value (dp,ar(4),in)
                               - Real, Imag, RealOld, ImagOld
                               - Number of returned values (0 or 4)
     ResRdFix (int,sc,out)
```

2.3.13. ResRdForc (Retrieving Applied Nodal Loads Solution)

```
*deck,ResRdForc
    function ResRdForc (node,idof,value)
c primary function: Retrieve an applied force value

c object/library: ResRd

c input arguments:
c node (int,sc,in) - External node number
c idof (int,sc,in) - Internal dof number
c output arguments:
```

```
c value (dp,ar(4),in) - Real,Imag, RealOld,ImagOld
c ResRdForc (int,sc,out - Number of returned values (0 or 4)
```

2.3.14. ResRdEstr (Retrieving Element Solutions)

```
*deck,ResRdEstr
     function ResRdEstr (iStr,Str)
c primary function: Get an element's results

c object/library: ResRd

c input arguments:
     iStr (int,sc,in) - element record number (1-25)

c output arguments:
     ResRdEstr (int,sc,out) - Number of element values
     Str (dp,ar(nStr),out) - element values
```

Chapter 3: Using CDREAD and CDWRITE

3.1. Using the CDREAD Command

The CDREAD command and its GUI equivalent, Main Menu> Preprocessor> Archive Model> Read, read a file of model and database information into the ANSYS database. The commands and menu paths listed below define the input data that the ANSYS program requires to solve a model. If the file you are reading into the database via CDREAD or Main Menu> Preprocessor> Archive Model> Read does not contain all of the required input data, you can use these commands or menu paths to define that data in the preprocessor. For detailed information about the commands, see the ANSYS Commands Reference.

In the following list, commands or menu paths shown with an asterisk (*) are the minimum requirements for a solution.

Command	Equivalent Menu Path	Definition
/PREP7*	Main Menu> Preprocessor*	Enters the general preprocessor
ET*	Main Menu> Preprocessor> Element Type> Add/Edit/Delete*	Defines the element types
MP*	Main Menu> Preprocessor> Material Props*	Defines the material properties
МРТЕМР	Main Menu> Preprocessor> Material Props> Material Models	Defines a table of material temperatures
MPDATA	Main Menu> Preprocessor> Material Props> Material Models	Defines a table of material properties
ТВ	Main Menu> Preprocessor> Material Props> Material Models	Defines nonlinear material data, some element data, or both
R	Main Menu> Preprocessor> Real Constants> Add/Edit/Delete	Defines element real constants
LOCAL	Utility Menu> WorkPlane> Local Coordinate Systems> Create Local CS> At Specified Loc	Defines a local coordinate system
N*	Main Menu> Preprocessor> Modeling> Create> Nodes> In Active CS or Main Menu> Preprocessor> Modeling> Create> Nodes> On Working Plane	Defines a nodal location
E or EN*	Main Menu> Preprocessor> Modeling> Create> Elements> Auto Numbered> Thru Nodes or Main Menu> Preprocessor> Modeling> Create> Elements> User Numbered> Thru Nodes	Defines an element. (You must set the correct TYPE, MAT, REAL, and ESYS pointers before defining the element.)
ANTYPE	Main Menu> Preprocessor> Loads> Analysis Type> New Analysis	Defines the analysis type. See the ANSYS Commands Reference for details.
M	Main Menu> Preprocessor> Loads> Master DOFs> User Selected> Define	Defines master degrees of freedom
ACEL	Main Menu> Preprocessor> Loads> Define Loads> Apply> Structural> Inertia> Gravity	Defines the acceleration vector
D*	Main Menu> Preprocessor> Loads> Define Loads> Apply> constraint	Defines degree of freedom constraints
F	Main Menu> Preprocessor> Loads> Define Loads> Apply> force type> On entity	Defines nodal forces

Command	Equivalent Menu Path	Definition
SF or SFE	Main Menu> Preprocessor> Loads> Define Loads> Apply> surface load type> On entity	Defines surface loads on element faces
BF or BFE	Main Menu> Preprocessor> Loads> Define Loads> Apply> load type> On entity	Defines body forces on elements

3.1.1. Tips for Reading Files with CDREAD

The following list describes practices to follow when reading files with CDREAD or its menu path equivalent:

- If you place the command /NOPR at the beginning of the file and /GOPR at the end of the file, you can suppress printing of the file and speed up the time to read it.
- Use the /COM command to add comments to the file. If the file contains the /NOPR command, /COM provides status information about what is being read in. For example:

```
/COM, READING NODES
N,1,....
,
,
/COM, READING ELEMENTS
EN,1,....
```

- Group elements with the same attributes (TYPE, REAL, MAT, ESYS). Do not use a separate MAT, REAL,
 TYPE, and ESYS command for each element.
- Use **Utility Menu> File> Change Title** or the **/TITLE** command to add a title to graphics displays and printouts.
- Use Utility Menu> File> Read Input From or the /INPUT command at the Begin level to input the file.

3.2. Using the CDWRITE Command

To export a model from the ANSYS program to another application, use menu path **Main Menu> Preprocessor> Archive Model> Write** or the **CDWRITE** command within the general preprocessor, PREP7. This produces a coded database file called **Jobname.cdb**. You specify the jobname using **Utility Menu> File> Change Jobname** or the **/FILNAM** command. If you supply no jobname, the ANSYS program uses the default name "file".

The **Jobname.cdb** file contains selected geometry (nodes and elements), load items, and other model data in terms of ANSYS input commands. (For a complete list of data in the file, see the **CDWRITE** description in the *ANSYS Commands Reference*.) You can convert this information to a format compatible with the program into which you are importing it. The next few pages describe special considerations and commands you may need to do this conversion.

Note — Files created by the **CDWRITE** command have the active coordinate system set to Cartesian (**CSYS**, 0).

ANSYS may create parameters in the **CDWRITE** file that start with an underscore (_), usually an "_z." Such parameters are for ANSYS internal use and pass information to the ANSYS GUI.

3.2.1. Customizing Degree of Freedom Labels: the /DFLAB Command

The ANSYS program uses a set of default labels for the degrees of freedom. You use these labels when entering boundary conditions, or ANSYS uses the labels when writing the **Johname.cdb** file.

You can change the labels to reflect the degrees of freedom of the other program by issuing the command /DFLAB. If you are customizing the DOF labels, /DFLAB must be the first command you enter within the ANSYS program. You may want to include the command in your START.ANSfile. You can use /DFLAB only at the Begin processing level.

/DFLAB assigns or reassigns the "displacement" and "force" labels in the ANSYS DOF list. For example, degree of number 1 is predefined to have a displacement label of UX and a force label of FX, but you can assign new labels to this DOF using by issuing **/DFLAB**. Changing predefined labels generates a warning message.

The format for the **/DFLAB** command is:

/DFLAB, NDOF, LabD, LabF

NDOF

ANSYS degree of freedom number (1 to 32)

LabD

Displacement degree of freedom label to be assigned (up to four characters)

LabF

Force label to be assigned (up to four characters)

You can also use /**DFLAB** to assign labels to spare degree of freedom numbers. Spare displacement and force labels are from 13 to 18 and from 27 to 32. All other DOF numbers are predefined, as follows:

DOF Number	Corresponding Displace- ment Label	Corresponding Force Label
1	UX	FX
2	UY	FY
3	UZ	FZ
4	ROTX	MX
5	ROTY	MY
6	ROTZ	MZ
7	AX	CSGX
8	AY	CSGY
9	AZ	CSGZ
10	VX	VFX
11	VY	VFY
12	VZ	VFZ
19	PRES	FLOW
20	TEMP	HEAT
21	VOLT	AMPS
22	MAG	FLUX
23	ENKE	NPKE
24	ENDS	NPDS
25	EMF	CURT
26	CURR	VLTG

3.3. Coded Database File Commands

In the coded database file **Jobname.CDB**, most ANSYS commands have the same format they have elsewhere. (See the *ANSYS Commands Reference* for command-specific information.) However, the format for some commands differs slightly in the **Jobname.CDB** file. The format for these commands is described below.

The **CDWRITE** command has an UNBLOCKED and a BLOCKED option. The UNBLOCKED option will write all data out in command format, the default BLOCKED option will write certain data items in a fixed format, especially those which could potentially contain large amounts of data, such as nodal data.

3.3.1. CE Command

The **CE** command defines the constant term in a constraint equation. The command format in **Jobname.CDB** is:

```
CE, R5.0, Type, LENGTH, NCE, CONST
```

Type

The type of data to be defined. DEFI is the valid label.

LENGTH

The total number of variable terms in the constraint equation.

NCE

The constraint equation reference number.

CONST

The constant term of the equation.

Another version of the **CE** command defines the variable terms in a constraint equation. You must issue this version of the command after the **CE** command described above. This command repeats until all terms are defined.

The alternate format for the **CE** command is:

```
CE, R5.0, Type, N1, Dlab1, C1, N2, Dlab2, C2
```

Type

The type of data to be defined. NODE is the valid label.

Ν1

The node number of the next term.

Dlab1

The DOF label of N1.

C1

The coefficient of N1.

N2

The node number of the next term.

Dlab2

The DOF label of N2.

C2

The coefficient of N2.

3.3.2. CP Command

The **CP** command defines a coupled node set. You repeat the command until all nodes are defined. The command format in **Jobname.CDB** is:

```
CP, R5.0, LENGTH, NCP, Dlab, N1, N2, N3, N4, N5, N6, N7
```

LENGTH

The total number of nodes in the coupled set

NCP

The coupled node reference number

Dlab

The degree of freedom label for the set

N1,N2,N3,N4,N5,N6,N7

The next seven node numbers in the coupled set

3.3.3. CMBLOCK Command

The **CMBLOCK** command defines the entities contained in a node or element component. The command format in **Johname.CDB** is:

```
CMBLOCK,Cname,Entity,NUMITEMS
Format
```

Cname

Eight character component name.

Entity

Label identifying the type of component (NODE or ELEMENT).

NUMITEMS

Number of items written.

Format

Data descriptors defining the format. For **CMBLOCK** this is always (8i10).

The items contained in this component are written at 10 items per line. Additional lines are repeated as needed until all NumItems are defined. If one of the items is less than zero, then the entities from the item previous to this one (inclusive) are part of the component.

3.3.4. EBLOCK Command

The **EBLOCK** command defines a block of elements. The command syntax is:

```
EBLOCK, NUM_NODES, Solkey Format
```

NUM NODES

The number of nodes to be read in the first line of an element definition.

Solkey

The solid model key. The element is part of a solid model if the keyword SOLID appears here. When Solkey = SOLID, Field 8 (the element shape flag) may be left at zero, and Field 9 is the number of nodes defining this element.

Format

Data descriptors defining the format. This must be 19i7.

The format of the element "block" is as follows:

- Field 1 The material number.
- Field 2 The element type number.
- Field 3 The real constant number.
- Field 4 The section ID attribute (beam section) number.
- Field 5 The element coordinate system number.
- Field 6 The birth/death flag.
- Field 7 The solid model reference number.
- Field 8 The element shape flag.
- Field 9 The number of nodes defining this element if Solkey = SOLID; otherwise, Field 9 = 0.
- Field 10 The exclude key (p-elements).
- Field 11 The element number.
- Fields 12-18 The node numbers. The next line will have the additional node numbers if there are more than eight.

The final line of the block will be a -1 in field 1.

If you are in the GUI, the **EBLOCK** command must be contained in an externally prepared file and read into ANSYS (i.e., **CDREAD**, /**INPUT**, etc.).

3.3.5. EDCADAPT Command

The **EDCADAPT** command specifies adaptive meshing control for explicit dynamics analysis. The command format in **Jobname.CDB** is:

 $\verb"EDCADAPT", R5.3", FREQ, TOL, OPT", \verb"MAXLVL", BTIME", DTIME", LCID", ADPSIZE", ADPASS", IREFLG", ADPENE", ADPTH", \verb"MAXELL", ADPSIZE", ADPASS", IREFLG", ADPENE", ADPTH", \verb"MAXELL", ADPSIZE", ADPASS", IREFLG", ADPENE", ADPTH & ADPTH &$

FREQ

The time interval between adaptive mesh refinement.

TOL

The adaptive angle tolerance (in degrees).

OPT

The adaptivity option.

MAXLVL

The maximum number of mesh refinement levels.

BTIME

The birth time to begin adaptive meshing.

DTIME

The death time to end adaptive meshing.

LCID

The curve ID defined by **EDCURVE**

ADPSIZE

The minimum element size to be adapted, based on the element edge length.

ADPASS

The one-pass or two-pass adaptivity option.

IREFLG

The uniform refinement level flag.

ADPENE

Adaptive mesh flag for starting adaptivity when approaching (positive ADPENE) or penetrating (negative ADPENE) the tooling surface

ADPTH

Absolute shell thickness level below which adaptivity should begin.

MAXEL

The maximum number of elements at which adaptivity will be terminated.

NOTE: This command is also listed in the ANSYS Commands Reference. The format listed here contians information specific to the CDREAD/CDWRITE file.

3.3.6. EDCGEN Command

The **EDCGEN** command is used to define a contact definition for explicit dynamics. The command format in **Jobname.CDB** is:

```
EDCGEN, R5.3, Option, Cont, Targ, Lkey, FS, FD, DC, VC, VDC, V1, V2, V3, V4, BTIME, DTIME, BOXID1, BOXID2
```

Option

The label identifying the contact behavior.

Cont

The contact surface, identified by component name, part ID, or part assembly ID.

Targ

The target surface, identified by component name, part ID, or part assembly ID.

Lkey

A key identifying the meaning of Cont and Targ (component, part or part assembly).

FS

The static friction coefficient.

FD

The dynamic friction coefficient.

DC

The exponential decay coefficient.

VC

The coefficient of viscous friction.

VDC

The viscous damping coefficient in percent of critical damping.

V1, V2, V3, V4

Additional input for some contact types. See **EDCGEN** in the ANSYS Commands Reference for more information.

BTIME

The birth time for which conatct definition will become active.

DTIME

The death time for which conatct definition will become inactive.

BOXID1

Contact volume as defined using EDBOX

BOXID2

Target volume as defined using EDBOX

NOTE: This command is also listed in the ANSYS Commands Reference. The format listed here contians information specific to the CDREAD/CDWRITE file.

3.3.7. EDCURVE Command

The **EDCURVE** command is used to define a curve for an explicit dynamics analysis. The command format in **Johname.CDB** is:

EDCURVE, R5.3, Option, LCID, Length, 0.0, Par1, Par2

Option

The **EDCURVE** command option. The only valid option is "ADD."

LCID

The curve ID.

Length

The number of data values for the abcissa array (Par1) and the ordinate array (Par2).

Par1

The abcissa values, repeat Length number of times.

Par2

The ordinate values, repeat *Length* number of times.

NOTE: This command is also listed in the ANSYS Commands Reference. The format listed here contians information specific to the CDREAD/CDWRITE file.

3.3.8. EDDRELAX Command

The **EDDRELAX** command activates initialization to a prescribed geometry or dynamic relaxation for the explicit analysis. The command format in **Jobname.CDB** is:

```
EDDRELAX, R5.4, Option, NRCYCK, IRELAL, EDTTL, DRTOL, DFFCTR, DRTERM, TSSFDR
```

Option

EDDRELAX command option. Valid options are "ANSYS" (relaxation is based on the implicit analysis, see the **EDDRELAX** command in the *ANSYS Commands Reference*) or "DYNA," where the relaxation parameters are controlled within the LS-DYNA analysis. The following arguments are valid for <code>option=DYNA</code> only.

NRCYCK

The number of iterations between the convergence checks.

IRELAL

Automatic control based on Papadrakakis not active (0) or active (1).

EDTTL

The convergence tolerance when automatic control is used.

DRTOL

The convergence tolerance.

DFFCTR

The dynamic relaxation factor.

DRTERM

The termination time for dynamic relaxation.

TSSFDR

The scale factor for each computed time step.

NOTE: This command is also listed in the ANSYS Commands Reference. The format listed here contians information specific to the CDREAD/CDWRITE file.

3.3.9. EDLCS Command

The **EDLCS** command is used to define a local coordinate system for explicit dynamics. The command format in **Jobname.CDB** is:

EDLCS, R5.3, Option, CID, X1, Y1, Z1, X2, Y2, Z2, X3, Y3, Z3

Option

The **EDLCS** command option. The only valid option is "ADD."

CID

The coordinate system ID.

X1,Y1,Z1,

The X,Y,Z coordinate of a point on the local X-axis.

X2.Y2.Z2

The X,Y,Z coordinate of a point on the local X-Y plane.

X3,Y3,Z3,

The X,Y,Z coordinate of the local origin.

NOTE: This command is also listed in the ANSYS Commands Reference. The format listed here contians information specific to the CDREAD/CDWRITE file.

3.3.10. EDLOAD Command

The **EDLOAD** command is used to define loading conditions for explicit dynamics. The command format in **Jobname.CDB** is:

EDLOAD, R5.3, Option, Lab, KEY, Cname, Length, PHASE, Par1, Par2, LCID, SCALE, BTIME, DTIME

Option

The **EDLOAD** command option. The only valid option is "ADD."

Lab

The load labels.

Key

The coordinate system number defined by EDLCS or the element face number for the pressure loading.

Cname

The name of the existing component or part number to which this load will be applied.

Length

The number of data values for the time array (Par1) and the load array (Par2).

Phase

Phase of the analysis in which the load curve is to be used.

Par1

The time values, with the number of values in the string defined by the Length argument (above).

Par2

The load values, with the number of values in the string defined by the Length argument (above).

LCID

The curve ID, created using the **EDCURVE** command. If LCID is nonzero, then Length = 1, and Par1 and Par2 will be equal to 0.

Scale

The Scale Factor applied to the load curve.

Btime

The birth time.

Dtime

The death time.

NOTE: This command is also listed in the ANSYS Commands Reference. The format listed here contians information specific to the CDREAD/CDWRITE file.

3.3.11. EDPREAD Command

The **EDPREAD** command is used to internally write the part information to the Jobname.CDB file for explicit dynamics. Prior to Release 8.0, the command format in **Jobname.CDB** is:

```
EDPREAD,R5.4,Nmat,Npart
Type, Mat, Real, Used
```

Nmat

The number of materials.

Npart

Number of parts, and also, the number of times to repeat the second Type,Mat,Real,Used input line.

Type

The element type number.

Mat

The material number.

Real

The real constant set number.

Used

The flag indicating if the part is used (1), or not used (0).

For Release 8.0 and beyond, the command format is:

```
EDPREAD,R8.0,Nmat,Npart,Part ID
Type, Mat, Real, Used
```

Nmat

The number of materials.

Npart

Number of parts, and also, the number of times to repeat the second Type,Mat,Real,Used input line.

PartID

The part number.

Type

The element type number.

Mat

The material number.

Real

The real constant set number.

Used

The flag indicating how many elements use PartID. If USED = 0, PartID is not used.

3.3.12. EDWELD Command

The **EDWELD** command is used to define a spotweld or a generalized weld for explicit dynamics.

There are two command formats (for spot and generalized welds). The command format for the spotweld appears in **Johname.CDB** as follows:

```
EDWELD, R5.3, Option, NWELD, N1, N2, SN, SS, EXPN, EXPS
```

Option

The **EDWELD** command option. The only valid option is "ADD."

NWELD

The spotweld ID number.

N1

The node number of the first node connected by the spotweld.

N2

The node number of the second node connected by the spotweld.

SN

The normal force at the spotweld failure.

SS

The shear force at the spotweld failure.

EXPN

The exponent for spotweld normal force.

EXPS

The exponent for spotweld shear force.

The command format for the generalized weld appears in **Jobname.CDB** as follows:

```
EDWELD, R5.3, Option, NWELD, CNAME,, SN, SS, EXPN, EXPS, EPSF, TFAIL, NSW, CID
```

Option

The **EDWELD** command option. The only valid option is "ADD."

NWELD

The generalized weld ID number.

CNAME

The name of the node component.

SN

The normal force at the weld failure.

SS

The shear force at the weld failure.

EXPN

The exponent for weld normal force.

EXPS

The exponent for weld shear force.

EXPE

The effective plastic strain at ductile failure.

TFAIL

The time of failure of the weld.

NSW

The number of spotwelds for the generalized weld.

CID

The coordinate system ID as defined by the **EDLCS** command.

NOTE: This command is also listed in the ANSYS Commands Reference. The format listed here contians information specific to the CDREAD/CDWRITE file.

3.3.13. **EN Command**

The **EN** command is used to define an element. If an element contains more than eight nodes, the **EN** command is repeated until all nodes are defined. The command format in **Johname.CDB** is:

```
EN, R5.5, Type, NUMN, I1, I2, I3, I4, I5, I6, I7, I8
```

The type of data to be defined. Valid labels are "ATTR" (read in element attributes), and "NODE" (read in nodes defining the element).

NUMN

The number of nodes.

11,12,13,1415,16,17,18

The integer values to be read:

- If Type is ATTR, the integer values are the element attributes. Attributes are in the order: NUMN,MAT,TYPE,REAL,SECNUM,ESYS,NUMELEM,SOLID,DEATH,EXCLUDE
- If Type is NODE, the integer values are the node numbers.

3.3.14. LOCAL Command

The LOCAL command defines a local coordinate system. The command format in Johname.CDB is:

```
LOCAL, R5.0, Type, NCSY, CSYTYP, VAL1, VAL2, VAL3
```

Туре

The type of data to be defined. Valid labels are LOC (read in system origin), ANG (read in rotation angles), and PRM (read in system parameters).

NCSY

The coordinate system reference number.

CSYTYP

The coordinate system type (0, 1, 2, or 3).

VAL1,VAL2,VAL3

Values to be read:

- If Type is LOC, values are the system origin in global Cartesian coordinates.
- If Type is ANG, values are the rotation angles in degrees.

If Type is PRM, values are the first and second parameters of the system.

3.3.15. M Command

The M command defines a master degree of freedom. The command format in Jobname.CDB is:

M,R5.0,NODE,Dlab

NODE

The node number

Dlab

The DOF label

3.3.16. MPDATA Command

The **MPDATA** command defines a material property data table. You repeat the command until all properties are defined. The command format in **Jobname.CDB** is:

MPDATA, R5.0, LENGTH, Lab, MAT, STLOC, VAL1, VAL2, VAL3

LENGTH

The total number of temperatures in the table.

Lab

The material property label. See the **MP** command description in *ANSYS Commands Reference* for valid labels.

MAT

The material reference number.

STLOC

The starting location in the table for the next three property values.

VAL1,VAL2,VAL3

Property values assigned to three locations in the table starting at STLOC.

3.3.17. MPTEMP Command

The **MPTEMP** command defines a temperature table. You repeat the command until all temperature values are defined. The command format in **Jobname.CDB** is:

```
MPTEMP, R5.0, LENGTH, STLOC, TEMP1, TEMP2, TEMP3
```

LENGTH

The total number of temperatures in the table

STLOC

The starting location in the table for the next three temperature values

TEMP1,TEMP2,TEMP3

Temperatures assigned to three locations in the table starting at STLOC

3.3.18. N Command

If the UNBLOCKED option is used with the **CDWRITE** command, then the **N** command defines a node. This is also the method used for defining nodes in **.CDB** files before ANSYS 5.4. The command format in **Jobname.CDB** is:

N, R5.3, Type, NODE, SOLID, PARM, VAL1, VAL2, VAL3

Type

The type of data to be defined. Valid labels are LOC (read in coordinates) and ANG (read in rotation angles).

NODE:

The node number.

SOLID

The solid model reference key. Not present for Type = ANG.

PARM

Line parameter value (0 if not on line). Not present for Type = ANG.

VAL1,VAL2,VAL3

Values to be read:

- If Type is LOC, values are the coordinates in the global Cartesian system.
- If Type is ANG, values are the rotation angles in degrees.

3.3.19. NBLOCK Command

The **NBLOCK** command defines a block of nodes. This is the recommended method for inputting nodes into the ANSYS data base. The command syntax is:

```
NBLOCK, NUMFIELD, Solkey Format
```

NUMFIELD

The number of fields in the blocked format.

Solkey

The solid model key. The node is part of a solid model if the keyword SOLID appears here.

Format

Data descriptors defining the format. This must be (3i8,6e16.9).

The format of the node "block" is as follows:

- Field 1 Node number.
- Field 2 The solid model entity (if any) in which the node exists.
- Field 3 The line location (if the node exists on a line).
- Field 4 6 The nodal coordinates.
- Field 7 9 The rotation angles.

Only the last nonzero coordinate/rotation is output; any trailing zero values are left blank.

The final line of the block is always an **N** command using a -1 for the node number.

The following example shows a typical **NBLOCK** formatted set of node information. Note that this example has no rotational data. It contains only the first six fields.

```
NBLOCK,6
(i8,6e16,9)

1 6.21299982 0.625999987 -1.019883480E-07
2 6.14472103 0.625999987 0.156284466
3 6.21271753 0.625999987 1.096193120E-02

.
.
.
.
151464 0 0 5.85640764 -0.442010075 1.911501959E-02
```

```
151465 0 0 5.88715029 -0.442010075 7.201258256E-08
151466 0 0 5.85541868 -0.442010075 7.201258256E-08
N, R5.3,LOC, -1
```

If you are in the GUI, the **NBLOCK** command must be contained in an externally prepared file and read into ANSYS (i.e., **CDREAD**, /INPUT, etc.).

3.3.20. R Command

The **R** command defines a real constant set. You repeat the command until all real constants for this set are defined. The command format in **Johname.CDB** is:

```
R, R5.0, NSET, Type, STLOC, VAL1, VAL2, VAL3
```

NSET

The real constant set reference number.

Туре

The type of data to be defined. LOC is the valid label.

STLOC

The starting location in the table for the next three constants.

VAL1,VAL2, VAL3

Real constant values assigned to three locations in the table starting at STLOC.

3.3.21. RLBLOCK Command

The **RLBLOCK** command defines a real constant set. The real constant sets follow each set, starting with Format1 and followed by one or more Format2's, as needed. The command format is:

```
RLBLOCK, NUMSETS, MAXSET, MAXITEMS, NPERLINE Format1
Format2
```

NUMSETS

The number of real constant sets defined

MAXSET

Maximum real constant set number

MAXITEMS

Maximum number of reals in any one set

NPERLINE

Number of reals defined on a line

Format1

Data descriptor defining the format of the first line. For the **RLBLOCK** command, this is always (2i8,6g16.9). The first i8 is the set number, the second i8 is the number of values in this set, followed by up to 6 real constant values.

Format2

Data descriptors defining the format of the subsequent lines (as needed); this is always (7g16.9).

The real constant sets follow, with each set starting with Format1, and followed by one or more Format2's as needed.

3.3.22. SECBLOCK Command

The **SECBLOCK** command retrieves all mesh data for a user-defined beam section as a block of data. You repeat the command for each beam section that you want to read. The command format is:

SECBLOCK Format1 Format2 Format3

Format1

The First Line section. The first value is the number of nodes, and the second is the number of cells.

Format2

The Cells Section. The first 9 values are the cell connectivity nodes. The 10th (last) value is the material ID (**MAT**).

Format3

The Nodes Section. This section contains as many lines as there are nodes. In this example, there are 27 nodes, so a total of 27 lines would appear in this section. Each node line contains the node's boundary flag, the Y coordinate of the node, and the Z coordinate of the node. Currently, all node boundary flags appear as 0s in a cell mesh file. Because all node boundary flags are 0, **SECBLOCK** ignores them when it reads a cell mesh file.

Sample User Section Cell Mesh File

Following is a sample excerpt from a custom section mesh file for a section with 27 nodes, 4 cells, and 9 nodes per cell:

First Line:	27	4									
Cells Section:		1 7 9 11	3 9 11 13	11 23 25 27	9 21 23 25	2 8 10 12	6 16 18 20	10 22 24 26	4 14 16 18	5 15 17 19	2 1 1 1
Nodes Section:	0 0 0 0 0 0	0.0 0.0 0.0 5.0 19.	25 5 175 98		0.0 0.0 0.0 0.0 10.0						

3.3.23. SFBEAM Command

The **SFBEAM** command defines a surface load on selected beam elements. Remaining values associated with this specification are on a new input line with a (4f16.9) format. The command format in **Johname.CDB** is:

```
SFBEAM, ELEM, LKEY, Lab, R5.0, DIOFFST, DJOFFST
```

ELEM

The element number.

LKEY

The load key associated with these surface loads.

Lab

A label indicating the type of surface load. PRES (for pressure) is the only valid label.

DIOFFST

Offset distance from node I.

DJOFFST

Offset distance from node J.

3.3.24. SFE Command

The **SFE** command defines a surface load. Values associated with this specification are on a new input line with a (4f16.9) format. The command format in **Johname.CDB** is:

```
SFE, ELEM, LKEY, Lab, KEY, R5.0
```

ELEM

The element number.

T.KEY

The load key associated with this surface load.

Lab

A label indicating the type of surface load: Valid labels are:

- PRES (pressure)
- CONV (convection)
- HFLU (heat flux)
- IMPD (impedance)
- SEL (substructure load vector)
- SELV (S. E. load vectors)
- CHRG (charge density)

KEY

A value key. If it is 1, the values are real (film coefficient if convection). If it is 2, values are imaginary (bulk temperature if convection).

Chapter 4: ANSYS Graphics File Format

4.1. Modifying ANSYS Graphics Files

Some ANSYS users may wish to translate ANSYS graphics files to other formats (such as Encapsulated PostScript or Al). If you plan to translate graphics files, this chapter provides some information to help you:

• Source code, with comments, for a program called PLOT33 which plots all of the plots on the coded plot file. You can link this program with user-supplied Calcomp HCBS software (plot, plots, symbol) or other software that uses the Calcomp subroutine protocol. For example, Hewlett-Packard's ISPP product, Tektronix's Preview product, and Veratec's Versaplot product use the Calcomp protocol.

To work with other plotter software, you may need to remove the calls to the Calcomp subroutine (plot, plots, and symbol) and substitute the subroutine calls for the plotter software being used.

Note — Because ANSYS customers use a wide variety of plotters, ANSYS, Inc. can not verify the use of the PLOT33 program with all plotter types.

• A description of the format for the ANSYS neutral graphics file. This listing excludes format information for z-buffered graphics, but the PLOT33 program *does* include a section on z-buffered graphics.

4.2. Pixmap Format for Graphic Display Files

The ANSYS graphics display is KPX pixels high by KPX * 1.33 pixels wide.

KPX is the resolution specified by the /GFILE, SIZE command (where SIZE is the pixel resolution) or by choosing menu path Utility Menu>PlotCtrls>Redirect Plots>To File. Default resolution is 800.

IX1,IY1 is the lower left corner of the z-buffer image.

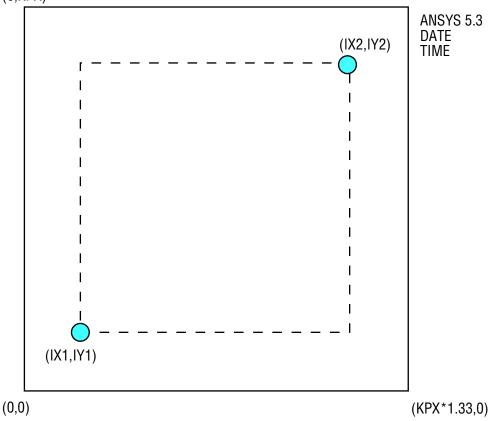

IX2,IY2 is the upper right corner of the z-buffer image.

The image should be mapped to the hardcopy device accordingly.

The following graphic illustrates the items described above:

Figure 4.1 Display Format for Z-buffered Graphics

4.3. Neutral Graphics File Format

The neutral graphics file is an 80-byte, ASCII coded file with fixed length records. It contains plot directives representing the image of a display, as formed in ANSYS, encoded onto a host-independent, printable character set.

Most ANSYS users will not need to know the format of the graphics file. However, in rare cases, you may want to edit your graphics file or, as a programmer, you may need to know the file format to write a program that reads it. Although the file is ASCII coded, it can be difficult to interpret. This section gives details about the file format.

4.3.1. Characters the Graphics File Uses

The host-independent printable character set consists of the ASCII characters listed below:

- Numerals 0, 1, 2, 3, 4, 5, 6, 7, 8, and 9
- Uppercase alphabetic characters A through Z
- The following characters: \$ () * + , . < = >
- The space character, " ".

4.3.2. Graphics File Directives

Graphics files contain a set of directives that define various aspects of how ANSYS displays a plot, such as window coordinates, colors for graphs and test, line dimensions, and so on. Each directive consists of a command character followed by one or more parameters.

Within a graphics file, one directive directly follows the preceding directive. For example, below is the first line of a graphics file:

(BBAAA2A0AAAAAPPPLPO>AP\$MEKLKBAJANSYS 5.3\$MEKLEFALNOV 15 1996\$MEKKOJAI10:01:40

The text of this example line breaks down as follows:

(BBAAA	The Start-Plot directive, beginning with command character. (B, B, A, A, and A are the values of parameters defining the plot environment. (Parameters for all plot directives, and their possible values, are explained later.)
2A	The Text-Size directive, which determines the type size of displayed text strings. The 2 is the command character, and A represents the size value.
0AAAAAAPPPLPO	The Window directive, which sets the coordinates for the displayed image. 0 is the command character. AAAAAA represents the first set of coordinates (the lower left corner of the image), and PPPLPO represents the second coordinate set (the right upper corner of the image).
>AP	The Text-Color directive, which sets the color of displayed text. > is the command character. AP is a parameter value specifying the color.
\$MEKLKBAJANSYS 5.3	The first of several Text directives. \$ is the command character, MEKLKB are the coordinates for the text, AJ is the number of characters in the string, and ANSYS 5.3 is the text string itself.
\$MEKLEFALNOV 15 1996	A second Text directive, defining the position and length of the string NOV 15 1996.
\$MEKKOJAI10:01:40	A third Text directive, defining the position and length of the string 10:01:40

4.3.2.1. Parameter Types for Graphics File Directives

The descriptions of graphics file directives in the next section include discussions of the parameter or parameters for each directive. There are five types of parameters:

Parameter Type	Parameter Attributes	Valid Parameter Values
Int	1 byte, base 16 (letters A through P)	0 through 15
Long	2 bytes, base 16 (letters A through P)	0 through 255
Byt3	3 bytes, base 16 (letters A through P)	0 through 65535
Ху	6 bytes, base 16 (letters A through P)	0 through 4095, mapped to coordinate space of -1.0 to 1.67

4.3.2.2. Directive Descriptions

The next few pages describe each of the graphics file directives. Parameters are always specified in the order shown below.

Graphics Direct- ive	Command Character	Parameters	Parameter Types
Start_Plot	(keras - Defines whether the display surface is cleared prior to the plot (0 = do not clear the surface, 1 = clear it)	Int, Int, Int, Int, Int
		kras - Defines whether the display uses raster mode or vector mode (1 = raster mode, 0 = vector mode)	
		kcntr - Defines whether the display uses a contour color map or shading color map (1 = contour, 0 = shading)	
		kdocu - Defines whether the Docu column is compressed (1 = do not compress, 0 = compress)	
		ispare - A spare value	
Window	0	x1,y1, x2,y2 (x and y coordinates)	Xy, Xy
Area-Color	<	iclra - Sets the color for the displayed area. (See "Color Specification" below.)	Long
Graph-Color	=	iclrg - Sets the color for the displayed graph. (See "Color Specification" below.)	Long
Text-Color	>	icIrt - Sets the color for displayed text. (See "Color Specification" below.)	Long
Text-Size	2	tsize - Defines the size of displayed text (0 = normal, 1 = small)	Int
Line-Type	,	Itype - Defines the type of lines used in the display $(0 = \text{solid}, 1 = \text{dashed})$	Int
Line-Width	1	lwidth - Defines the width of displayed lines (0 = normal, 1 to 5 = larger line size)	Int
Marker Size	3	size - Defines the size of the node marker (0 = the smallest size, 15 = the largest size)	int
Point	*	x,y - Defines a point at coordinates x,y	Ху
Move		x,y - Moves to coordinates x,y	Ху
Draw	-	x,y - Draws a line to coordinates x,y	Ху
Text	\$	x,y - Sets coordinates for where text will display	Xy, Long, String
		nchar - Defines the number of displayed characters	
		string - Defines the text string itself	
Normal	/	inorm - This value, divided by 255, is cos(), where is the viewing direction and the surface normal of subsequent polygons	Long

Graphics Direct- ive	Command Character	Parameters	Parameter Types
Polygon	+	n - Defines the number of polygon vertices kedge - Defines whether the polygon edge is dis- played (0, = do not display edge, 1 = display it) xy1,xyn - Defines coordinates for the polygon	Int, Int, XyXy
No-Op	none	no parameters	none
End-Plot)	no parameters	none
Pixmap	Z	kpx - Defines the pixel resolution x1,y1 - Sets coordinates for the lower left corner of the z-buffer image x2,y2 - Sets coordinates for the upper right corner of the z-buffer image The following three parameters are run-length encoded data which repeats until all pixels are read in, as defined by the window (X2-X1 + 1) * (Y2-Y1 + 1) n - Defines the number of pixels in a row inrm - Sets the normal for pixels iclr - Sets the color for the pixmap	Byt3, Xy, Xy, Long, Long, Long,

4.3.2.3. Color Specification

Below is the list of color specifications used by the directives that set colors for areas, graphs, and text. If more than a single intensity of a color is available, use the value specified by the **Normal** directive to complete the selection. *Normal* of 0 represents the lowest intensity and *normal* of 255 represents the highest intensity.

Value	Color
0	Black
1	Cyan
2	Blue-Magenta
3	Red
4	Cyan-Blue
5	Magenta-Red
6	Green
7	Orange
8	Magenta
9	Yellow-Green
10	Blue
11	Green-Cyan
12	Yellow
13	Dark Gray
14	Light Gray
15	White

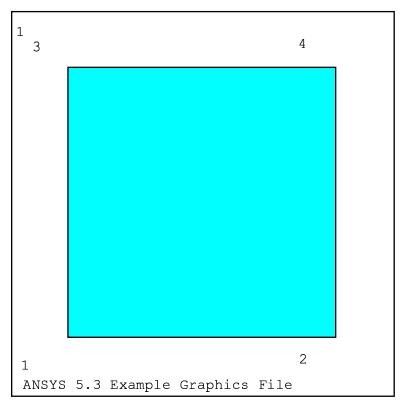

Value	Color
16	
:	Reserved for future use
127	
128	Blue
:	:
	Cyan
	:
	Green
	:
	Indices 128 through 255 represent the color spectrum used to display the Low (Blue) to High (Red) con- tour values.
	:
	Yellow
	:
	Orange
:	:
255	Red

4.4. Decoding a Graphics File: an Example

The following example shows you the following:

- The ANSYS command stream used to create a simple graphics plot, shown in Figure 4.2: "Example Display of a Graphics File" below
- The encoded graphics file that these commands produce
- · The decoded graphics plot directives

Figure 4.2 Example Display of a Graphics File

ANSYS 5.3

PLOT NO. 1
ELEMENTS
ELEM NUM

ZV =1
DIST=0.55
XF =1.5
YF =0.5
CENTROID HIDDEN

4.4.1. The Example Command Stream

To create the graphics display shown in Figure 4.2: "Example Display of a Graphics File", you would issue the following ANSYS commands:

```
/PREP7
/TITLE, ANSYS 5.3 Example Graphics File N,1,1
N,2,2
NGEN,2,2,1,2,1,,1
ET,1,42
E,1,2,4,3
/PNUM,ELEM,1
/PNUM,NODE,1
/SHOW,F33
EPLOT
FINISH
```

4.4.2. Example Graphics File Contents

The commands listed above produce the display shown in Figure 4.2: "Example Display of a Graphics File" and the following graphics file:

```
(BBAAA2A0AAAAAPPPLPO&#60AA&#62AP$MEKLKBAJANSYS 5.3$MEKLEFALNOV 16 1996$MEK KOJAI15:57:07$MEKKIMAMPLOT NO. 1$MEKKDAAIELEMENTS$MEKJNEAIELEM NUM2 B0AAAAAALPOLPO&#60AB/PP+EBBBHBBHKOGBBHKOGKOGBBHKOG$FPPFPPAB1$AILAILAB1$L HCAILAB2$LHCLHCAB4$AILLHCAB32A0AAAAAAPPPLPO.AAAAA-LPOAAA-LPOLPO-AAAL PO-AAAAAA>AB$ABLLKBAB1>AP$MEKJBLAGZV =1$MEKILPAJDIST=0.55$MEKIGCAIXF =1.5$MEKIAGAIYF =0.5$MEKHKKAPCENTROID HIDDEN$ABOABOCA ANSYS 5.3 Ex ample Graphics File)
```

The decoded plot directives are:

(BBAAA	Start-Plot: /ERASE, raster mode
